4. The names "Xalan" and "Apache Software Foundation" must not be used to endorse or promote products derived from this software without prior written permission. For written permission, please contact apache@apache.org.

5. Products derived from this software may not be called "Apache", nor may "Apache" appear in their name, without prior written permission of the Apache Software Foundation. THIS SOFTWARE IS PROVIDED ``AS IS" AND ANY EXPRESSED OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DIS-CLAIMED. IN NO EVENT SHALL THE APACHE SOFTWARE FOUNDATION OR ITS CONTRIBUTORS BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARIS-

ING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

This software consists of voluntary contributions made by many individuals on behalf of the Apache Software Foundation and was originally based on software copyright (c) 1999, Lotus Development Corporation., http://www.lotus.com. For more information on the Apache Software Foundation, please see http://www.apache.org/.

Progress Artix ESB for C++ v5.6 incorporates Apache Velocity v1.3 technology from the Apache Software Foundation (http://www.apache.org). Such Apache technology is subject to the following terms and conditions: The Apache Software License, Version 1.1 - Copyright (c) 2000-2003 The Apache Software Foundation. All rights reserved. Redistribution and use in source and binary forms, with or without modification, are permitted provided that the following conditions are met:

1. Redistributions of source code must retain the above copyright notice, this list of conditions and the following disclaimer.

2. Redistributions in binary form must reproduce the above copyright notice, this list of conditions and the following disclaimer in the documentation and/or other materials provided with the distribution.

3. The end-user documentation included with the redistribution, if any, must include the following acknowledgement: "This product includes software developed by the Apache Software Foundation (http://www.apache.org/)." Alternately, this acknowledgement may appear in the software itself, if and wherever such third-party acknowledgements normally appear.

4. The names "The Jakarta Project", "Velocity", and "Apache Software Foundation" must not be used to endorse or promote products derived from this software without prior written permission. For written permission, please contact apache@apache.org.

5. Products derived from this software may not be called "Apache", "Velocity" nor may "Apache" appear in their names without prior written permission of the Apache Group. THIS SOFTWARE IS PROVIDED ``AS IS" AND ANY EXPRESSED OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DIS-CLAIMED. IN NO EVENT SHALL THE APACHE SOFTWARE FOUNDATION OR ITS CONTRIBUTORS BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARIS-ING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

Progress Artix ESB for C++ v5.6 incorporates Log4J v1.2.6 technology from the Apache Software Foundation (http://www.apache.org). Such Apache technology is subject to the following terms and conditions: The Apache Software License, Version 1.1 - Copyright (C) 1999 The Apache Software Foundation. All rights reserved. Redistribution and use in source and binary forms, with or without modification, are permitted provided that the following conditions are met:

1. Redistributions of source code must retain the above copyright notice, this list of conditions and the following disclaimer.

2. Redistributions in binary form must reproduce the above copyright notice, this list of conditions and the following disclaimer in the documentation and/or other materials provided with the distribution.

3. The end-user documentation included with the redistribution, if any, must include the following acknowledgment: "This product includes software developed by the Apache Software Foundation (http://www.apache.org/)." Alternately, this acknowledgment may appear in the software itself, if and wherever such third-party acknowledgments normally appear.

4. The names "log4j" and "Apache Software Foundation" must not be used to endorse or promote products derived from this software without prior written permission. For written permission, please contact apache@apache.org.

5. Products derived from this software may not be called "Apache", nor may "Apache" appear in their name, without prior written permission of the Apache Software Foundation. THIS SOFTWARE IS PROVIDED ``AS IS" AND ANY EXPRESSED OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DISCLAIMED. IN NO EVENT SHALL THE APACHE SOFTWARE FOUNDATION OR ITS CONTRIBUTORS BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDEN-TAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLU DING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

This software consists of voluntary contributions made by many individuals on behalf of the Apache Software Foundation. For more information on the Apache Software Foundation, please see http://www.apache.org/>.

(a) Progress Artix ESB for C++ v5.6 incorporates JDOM Beta 9 technology from JDOM. Such technology is subject to the following terms and conditions: Copyright (C) 2000-2004 Jason Hunter & Brett McLaughlin. All rights reserved. Redistribution and use in source and binary forms, with or without modification, are permitted provided that the following conditions are met: 1. Redistributions of source code must retain the above copyright notice, this list of conditions, and the following disclaimer. 2. Redistributions in binary form must reproduce the above copyright notice, this list of conditions, and the disclaimer that follows these conditions in the documentation and/or other materials provided with the distribution. 3. The name "JDOM" must not be used to endorse or promote products derived from this software without prior written permission. For written permission, please contact <request_AT_jdom_DOT_org>. 4. Products derived from this software may not be called "JDOM", nor may "JDOM" appear in their name, without prior written permission from the JDOM Project Management <request_AT_jdom_DOT_org>. In addition, we request (but do not require) that you include in the end-user documentation provided with the redistribution and/or in the software itself an acknowledgement equivalent to the following: "This product includes software developed by the JDOM Project (http://www.idom.org/)." Alternatively, the acknowledgment may be graphical using the logos available at http:// www.jdom.org/images/logos. THIS SOFTWARE IS PROVIDED AS IS AND ANY EXPRESSED OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PAR-TICULAR PURPOSE ARE DISCLAIMED. IN NO EVENT SHALL THE JDOM AUTHORS OR THE PROJECT CONTRIBUTORS BE LIABLE FOR ANY DIRECT. INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAM-AGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES: LOSS OF USE. DATA. OR PROFITS: OR BUSINESS INTER-RUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLI-GENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFT-WARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE. This software consists of voluntary contributions made by many individuals on behalf of the JDOM Project and was originally created by Jason Hunter <jhunter_AT_jdom_DOT_org> and Brett McLaughlin <brett AT jdom DOT org>. For more information on the JDOM Project, please see <http://www.jdom.org/>

Progress Artix ESB for C++ v5.6 incorporates IBM-ICU v2.6 and IBM-ICU v2.6.1 technologies from IBM. Such technologies are subject to the following terms and conditions: Copvright (c) 1995-2003 International Business Machines Corporation and others All rights reserved. Permission is hereby granted, free of charge, to any person obtaining a copy of this software and associated documentation files (the "Software"), to deal in the Software without restriction, including without limitation the rights to use, copy, modify, merge, publish, distribute, and/or sell copies of the Software, and to permit persons to whom the Software is furnished to do so, provided that the above copyright notice(s) and this permission notice appear in all copies of the Software and that both the above copyright notice(s) and this permission notice appear in supporting documentation. THE SOFTWARE IS PRO-VIDED "AS IS", WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT OF THIRD PARTY RIGHTS. IN NO EVENT SHALL THE COPYRIGHT HOLDER OR HOLDERS INCLUDED IN THIS NOTICE BE LIABLE FOR ANY CLAIM, OR ANY SPECIAL INDIRECT OR CONSEQUENTIAL DAMAGES, OR ANY DAMAGES WHATSOEVER RESULTING FROM LOSS OF USE, DATA OR PROFITS, WHETHER IN AN ACTION OF CONTRACT, NEGLIGENCE OR OTHER TORTIOUS ACTION, ARISING OUT OF OR IN CONNECTION WITH THE USE OR PERFORMANCE OF THIS SOFTWARE. Except as contained in this notice, the name of a copyright holder shall not be used in advertising or otherwise to promote the sale, use or other dealings in this Software without prior written authorization of the copyright holder. All trademarks and registered trademarks mentioned herein are the property of their respective owners.

Progress Artix ESB for C++ v5.6 incorporates John Wilson MinML v1.7 technology from John Wilson. Such technology is subject to the following terms and conditions: Copyright (c) 1999, John Wilson (tug@wilson.co.uk). All rights reserved. Redistribution and use in source and binary forms, with or without modification, are permitted provided that the following conditions are met: Redistributions of source code must retain the above copyright

notice, this list of conditions and the following disclaimer. Redistributions in binary form must reproduce the above copyright notice, this list of conditions and the following disclaimer in the documentation and/or other materials provided with the distribution. All advertising materials mentioning features or use of this software must display the following acknowledgement: This product includes software developed by John Wilson. The name of John Wilson may not be used to endorse or promote products derived from this software without specific prior written permission. THIS SOFTWARE IS PROVIDED BY JOHN WILSON ``AS IS" AND ANY EXPRESS OR IMPLIED WARRANTIES. INCLUDING. BUT NOT LIMITED TO. THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DISCLAIMED. IN NO EVENT SHALL JOHN WILSON BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO. PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES: LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY. OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARIS-ING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

Progress Artix ESB for C++ v5.6 incorporates SourceForge - NET-SNMP v5.0.7 technology from SourceForge and Networks Associates Technology, Inc. Such technology is subject to the following terms and conditions: Various copyrights apply to this package, listed in various separate parts below. Please make sure that you read all the parts. Up until 2001, the project was based at UC Davis, and the first part covers all code written during this time. From 2001 onwards, the project has been based at SourceForge, and Networks Associates Technology, Inc hold the copyright on behalf of the wider Net-SNMP community, covering all derivative work done since then. An additional copyright section has been added as Part 3 below also under a BSD license for the work contributed by Cambridge Broadband Ltd. to the project since 2001. An additional copyright section has been added as Part 4 below also under a BSD license for the work contributed by Sun Microsystems, Inc. to the project since 2003. Code has been contributed to this project by many people over the years it has been in development, and a full list of contributors can be found in the README file under the THANKS section. ---- Part 1: CMU/UCD copyright notice: (BSD like) ----- Copyright 1989, 1991, 1992 by Carnegie Mellon University. Derivative Work - 1996, 1998-2000. Copyright 1996, 1998-2000 The Regents of the University of California. All Rights Reserved. Permission to use, copy, modify and distribute this software and its documentation for any purpose and without fee is hereby granted, provided that the above copyright notice appears in all copies and that both that copyright notice and this permission notice appear in supporting documentation, and that the name of CMU and The Regents of the University of California not be used in advertising or publicity pertaining to distribution of the software without specific written permission. CMU AND THE REGENTS OF THE UNIVERSITY OF CALIFORNIA DÍSCLAIM ALL WARRANTIES WITH REGARD TO THIS SOFTWARE, INCLUDING ALL IMPLIED WARRANTIES OF MERCHANTA-BILITY AND FITNESS. IN NO EVENT SHALL CMU OR THE REGENTS OF THE UNIVERSITY OF CALIFORNIA BE LIABLE FOR ANY SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES OR ANY DAMAGES WHATSOEVER RESULTING FROM THE LOSS OF USE. DATA OR PROFITS. WHETHER IN AN ACTION OF CONTRACT, NEGLIGENCE OR OTHER TORTIOUS ACTION, ARISING OUT OF OR

IN CONNECTION WITH THE USE OR PERFORMANCE OF THIS SOFTWARE. ----Part 2: Networks Associates Technology, Inc copyright notice (BSD) ----- Copyright (c) 2001-2003, Networks Associates Technology, Inc. LIST OF FIGURES

Preface

What is Covered in this Book

This book describes how to use the Artix session manager.

Who Should Read this Book

This book is intended for use by anyone who wants to use the Artix session manager.

How to Use this Book

This book is divided into the following chapters:

- Chapter 1, Introduction, which gives an overview of the Artix session manager.
- Chapter 2, Configuring and Deploying the Session Manager, which describes how to configure and deploy the Artix session manager.
- Chapter 3, Using the Session Manager from an Artix Client, which describes how to write a C++ client of a session managed service. In addition it covers important migration information about moving from Artix 3 to Artix 4 or higher.
- Chapter 4, Using the Session Manager from a non-Artix Client, which describes how to write both a .NET client and an Axis client of a session managed service.

The Artix Documentation Library

For information on the organization of the Artix library, the document conventions used, and where to find additional resources, see Using the Artix Library.

PREFACE

Introduction

The Artix session manager enables Web service clients to hold conversations with stateful servers. Client requests are identified as being part of a session and the server can hold state information relating to the client by identifying the requests as part of that client's session. In addition, the session manager controls the number of concurrent clients that can access a Web service and the amount of time allocated to each session.

This chapter includes the following sections:

What is the Session Manager?	page 24
Session Manager WSDL Contract	page 30

In this chapter

What is the Session Manager?

Overview	The Artix session manager is implemented as a group of plug-ins that work together to manage the number of concurrent clients allowed to connect to a group of services. An Artix plug-in is a code library that can be loaded into an Artix application at runtime. The session manager plug-ins work together to control how long a client has access to a service before it has to request an extension. In addition, the session manager notifies all registered services of session state changes, including when sessions begin and when they end. This section gives an overview of the session manager's use cases and describes
	the plug-ins and how they work together in a deployed system.
Use cases	The Artix session manager supports the following use cases:
	Limiting the amount of time a client is connected to a service
	You can use the Artix session manager to control the amount of time a client has access to a service. This is useful when you do not want clients to have unrestricted access to a service. For example, you might want to limit the amount of time available to complete a request form to five minutes. Clients can request session extensions.
	Limiting the number of concurrent client connections to a service
	You can specify how many concurrent connections are permitted to a service. For example, if your services are running on old hardware you could ensure higher performance by limiting the number of connections to a small number.
	Stateful services
	You can write services that store state data across multiple invocations. This is possible because clients of session managed services include identity details with each invocation. Using the session manager's callback mechanism, you can destroy any state information for a client once the client's session expires.
How the session manager works	Using a developer assigned group name, Artix servers register during start-up with the session manager. The session manager maintains a list of servers that register under the same group name. Servers that register under the same group name do not need to offer the same Web service.

Client applications contact the session manager and obtain a session ID for a specific group of servers. Client applications embed the session ID in a context, which must be included with all requests to begin, renew, or terminate a session. The session manager sends the clients a collection of endpoint references to all members of the group and the client determines what Web service is represented by each reference and uses the appropriate reference to instantiate a proxy and invoke on the Web service. The client includes the session ID with each invocation.

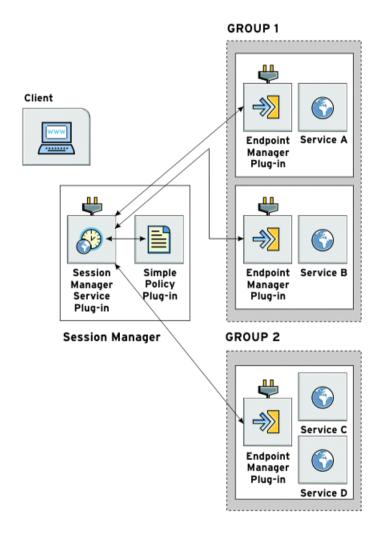

Session manager plug-ins	The two main session manager plu	The two main session manager plug-ins are:	
	Session manager service plug-in (session_manager_service)	This is the central service plug-in. It accepts and tracks service registration, hands out sessions to clients, accepts or denies session renewal, and notifies session endpoint managers of session state changes, including when sessions begin and when they end.	
	Session endpoint manager plug-i	n This is the portion of the session manager	
	(session_endpoint_manager)	that resides in a registered service. It registers its location with the service plug-in, and accepts or rejects client requests based on the validity of their session headers.	
	The session manager also includes a simple policy plug-in:		
	Session manager simple policy plug-in (sm_simple_policy)	This provides control over the allowable duration for a session and the maximum number of concurrent sessions allowed for each group.	
		plementation of the Artix session manager's ack interface. You can create your own	
	session policies by implementing this interface. For more detail, see		
	"Implementing your own Policy Plug-In" on page 43.		
How do the plug-ins interact?	· · ·	e session manager plug-ins are deployed in an r service plug-in and the simple policy plug-in	

are both deployed into the same Artix bus process.

In this example, these plug-ins are deployed in the Artix container. Although they can be deployed in any Artix process, the recommended approach is to use the Artix container. The session manager service plug-in and the simple policy plug-in interact to ensure that the session manager does not hand out sessions that violate the policies established by the simple policy plug-in. The simple policy plug-in makes all the decisions on which sessions are permitted. The session manager service queries this policy on all decisions. Artix provides a default implementation in the simple policy plug-in. You can, however, also write your own policy plug-in.

The endpoint manager plug-ins are deployed into the server processes that contain session managed services. A process can host two services (for example, *Service C* and *Service D* in Figure 1 on page 27), but the process can have only one endpoint manager. The endpoint manager plug-ins are in constant communication with the session manager service plug-in to report on endpoint health. They also receive information on new sessions that have been granted to the managed services, and check on the health of the session manager service.

What are sessions? The session manager controls access to services by handing out sessions to clients that request access to the services. A session is a pass that provides access to the services in a specific group for a specific amount of time. For example, the following process is used when a client application wants to use the services in a group named sales: 1. The client application asks the session manager for a session with the sales group. 2. The session manager checks and see if the sales group has an available session and, if so, it returns a session ID and the list of sales service references to the client. 3. The session manager notifies the endpoint managers in the sales group that a new session has been issued. It also supplies a new session ID, and a duration for which the session is valid. 4. When the client makes requests on the services in the sales group, it must include the session information as part of the request. 5. The endpoint manager for the services checks the session information to ensure it is valid. If it is, the request is accepted. If it is not, the request is rejected.

- 6. If the client wants to continue using the sales services beyond the duration of its session, the client must ask the session manager to renew its session before the session expires.
- 7. Lastly, when a client's session has expired, it must request a new one.

What are groups?	The Artix session manager does not pass out sessions for each individual service that is registered with it. Instead, services are registered as part of a <i>group</i> , and sessions are handed out for the group. A group is a collection of services that are managed as one unit by the session manager. While the session manager does not specify that the services in a group must be related, it is recommended that the endpoints have some relationship.
	A service's group affiliation is controlled by the configuration scope in which it is run. To change a service's group, edit the following value in the process configuration scope:
	plugins:session_endpoint_manager:default_group
	This specifies the default group name for the services instantiated by the server.
Set up steps	You set up the server side of the session manager using configuration. You do not need to write any dedicated server code. See "Configuring and Deploying the Session Manager" on page 33 for more detail.
	Session manager enabling a client requires dedicated coding. See "Using the Session Manager from an Artix Client" on page 49 and "Using the Session Manager from a non-Artix Client" on page 63 for details.
Demonstrations	Artix includes a number of session manager demonstrations, which are located in the following directory of your Artix installation:
	InstallDir/samples/advanced/session_management
	For details on how to run the demos, see the README.txt file located in this directory.

Session Manager WSDL Contract

Overview

The session manager service is described in the session-manager.wsdl contract, which defines the public interface through which the service can be accessed either locally or remotely. A copy of the session manager WSDL contract is stored in the following directory of your Artix installation:

```
InstallDir/wsdl/session-manager.wsdl
```

The session manager WSDL file defines two port types:

- SessionManager port type
- SessionEndpointManager port type

SessionManager port type The SessionManager port type includes operations through which a server process registers and deregisters its endpoint manager and endpoints with the session manager. In addition, it includes operations through which client applications can manage sessions and retrieve a collection of references to all server endpoints registered under a common group name. As an Artix developer you need only understand and use the following operations:

- beginSession—a request-response operation used by a client process to initiate a session. If the request to initiate a session is rejected, the session manager returns a BeginSessionFault.
- renewSession—a request-response operation used by a client process to renew a session. If the request to renew is rejected, the session manager returns a RenewSessionFault.
- endSession—a oneway operation used by a client process to terminate a session.
- getAllServiceEndpoints—a request-response operation used by a client process to obtain the collection of endpoint references belonging to a specific group. If the request is rejected, the session manager returns the GetAllEndpointsFault.

SessionEndpointManager port type	The SessionEndpointManager port type includes operations through which the session manager communicates session related events to the session endpoint manager associated with a registered service. As an Artix developer, you do not need to use the operations included in this port type.
Binding and protocol	The session manager is accessed through the SOAP binding and over the HTTP protocol.

CHAPTER 1 | Introduction

CHAPTER 2

Configuring and Deploying the Session Manager

This chapter explains how to configure and deploy the session manager.

In this chapter

This chapter discusses the following topics:

Deploying the Session Manager	page 34
Registering a Server with the Session Manager	page 40
Configuring the Simple Policy Plug-in	page 42
Implementing your own Policy Plug-In	page 43
Fault Tolerance	page 46
Adding SOAP 1.2 Support	page 47

Deploying the Session Manager

Overview	The Artix session manager is implemented using Artix plug-ins. This means that any Artix application can host the session manager's core functionality by loading the session_manager_service plug-in. However, it is recommended that you deploy the session manager using the Artix container. This section describes how to configure and deploy the session manager using
	the Artix container. It also explains how you can deploy the session manager using dynamic port allocation or using a fixed port, and how you can use the container service to shut down a running session manager.
If you are new to Artix configuration and deployment	If you are new to Artix configuration and deployment, you should read the introductory chapters of the Configuring and Deploying Artix Solutions, C++ Runtime guide.
Artix container	The Artix container is an executable, it_container, that provides a basic environment in which to run Web services. Service implementations are loaded into the container as plug-ins.
	For more information on the Artix container, see the <i>Deploying Services in an Artix Container</i> chapter in the Configuring and Deploying Artix Solutions, C++ Runtime guide.
Demo configuration file	The session manager demo includes an example session manager configuration file, called session_management.cfg, which is located in the following directory of your Artix installation:
	InstallDir/samples/advanced/session_management/etc

The configuration examples given in this chapter are taken from this file.

Configuring the session manager to run in the container

To configure the session manager service, ensure that the session_manager_service plug-in is included in the session manager service configuration scope, for example:

```
session_management {
    ...
    sm_service{
        orb_plugins = ["xmlfile_log_stream", "wsdl_publish",
        "session_manager_service", "sm_simple_policy"];
    ...
    };
```

The session_manager_service plug-in implements the session manager service functionality.

In this example the sm_simple_policy plug-in is also included in the orb_plugins list. If you want to customize settings for this policy, see "Configuring the Simple Policy Plug-in" on page 42.

You can write your own session management policy plug-in and, by adding it to the orb_plugins list, configure the session manager to use it. For more detail see "Implementing your own Policy Plug-In" on page 43.

If you do not specify a policy plug-in, the sm_simple_policy plug-in is loaded automatically by the session manager service.

Configuring a dynamic port

By default, the session manager is configured for deployment on a dynamic port. In the default session manager WSDL contract, the addressing information is as follows:

Example 1: Session Manager Service on Dynamic Port

The highlighted part shows the address. The localhost:0 port means that when you activate the session manager service, the operating system assigns a port dynamically on startup.

Because the port is assigned dynamically, you must ensure that your clients obtain a reference to the updated contract when it is assigned a port.

For details of using the Artix locator to do this, see the Artix Locator guide.

Configuring a fixed port There are two ways of configuring the session manager for deployment on a well-known fixed port. You can either edit the default session-manager.wsdl contract, or you can create a new session-manager.wsdl contract for your application.

Editing the default session manager contract

To edit the default session-manager.wsdl contract, perform the following steps:

1. Open the session-manager.wsdl contract in any text editor. It is located in the following directory of your Artix installation:

InstallDir/wsdl/session-manager.wsdl

 Edit the soap:address attribute at the bottom of the contract to specify the correct address. Example 2 shows a modified session manager service contract entry. The highlighted part has been modified to point to the desired address.

Example 2: Session Manager Service on Fixed Port

```
<service name="SessionManagerService">
  <port binding="sm:SessionManagerBinding"
   name="SessionManagerPort">
        <soap:address
        location="http://localhost:8080/services/sessionManagement/
        sessionManagerService"/>
        </port>
</service>
```

Creating a new session manager contract

To create a new session-manager.wsdl contract, perform the following steps:

- 1. Copy the default session-manager.wsdl contract to another location, and open it in any text editor.
- Edit the soap:address attribute at the bottom of the contract to specify the correct address. Example 2 shows a modified session manager service contract entry. The highlighted part has been modified to point to the desired address.
- 3. In your configuration file, in the application's scope, add a new bus:initial_contract:url:sessionmanager variable that points to your edited WSDL contract. For example:

bus:initial_contract:url:sessionmanager =
 "c:\myapp/wsdl/session-manager.wsdl";

The default bus:initial_contract:url:sessionmanager variable is in the Artix global scope, which ensures that every application has access to the contract. Specifying a new contract in your application scope overrides the global session manager contract for your application.

Configuring a range of portsYou can also limit the range of ports that the session manager is deployed on by
specifying a range of ports for the session managers SOAP or HTTP address.
Example 3 shows a modified session manager contract entry. The highlighted
part specifies the desired range of ports.

Example 3: Session Manager Port Range

```
<service name="SessionManagerService">
  <port binding="sm:SessionManagerBinding" name="SessionManagerPort">
    <soap:address
    location="http://localhost:11000-11100/services/sessionManagement/sessionManagerService"/>
  </port>
</service>
```

When the session manager has been correctly configured, it can be started like any other application. The only difference is that the session manager must be started before any servers that need to register with it.

Deploying the session manager using the container

To deploy the default session manager in the container, perform the following steps:

1. Run the session manager in the Artix container; for example:

```
it_container -ORBname demos.session_management.sm_service
    -ORBdomain_name session_management -ORBconfig_domains_dir
    ../../etc -publish
```

- -ORBname specifies the configuration scope under which the container runs the session manager.
- -ORBdomain_name specifies the name of the configuration file that stores the configuration information.
- -ORBconfig_domains_dir specifies the directory where Artix searches for the configuration file.
- Ask the container to publish the live version of the session manager WSDL that you use to initialize your clients. For example:

it_container_admin -container ../../etc/ContainerService.url
-publishwsdl -service
{http://ws.iona.com/sessionmanager}SessionManagerService
-file ..\..\etc\sessionmanager-activated.wsdl

The above command retrieves the session manager's activated WSDL contract. This is the contract in which 0 ports are dynamically updated with the actual port that the service runs on. In this example,

it_container_admin writes the contract to the

sessionmanager-activated.wsdl file in the etc subdirectory.

 Lastly, you must ensure that your clients use the updated WSDL file at runtime.

For more information on the Artix container and its command-line parameters, see the *Deploying Services in an Artix Container* chapter in the Configuring and Deploying Artix Solutions, C++ Runtime guide.

Deploying the session manager in the container on a fixed port	Alternatively, you can use the -port option to specify that the container runs a service on a fixed port. For example:
	<pre>it_container -port 9000 -ORBname demo.sessionmanager.service -ORBdomain_name session_management -ORBconfig_domains_dir //etc -publish</pre>
	In this example, any services that run in the container, and have default contracts with a port of 0, will not use port 9000.
	You can manually update the WSDL used by your client to 9000, or you can publish the WSDL from the container using it_container_admin with the -publishwsdl option, shown in "Deploying the session manager using the container" on page 38.
Shutting down the session manager	To shut down the session manager, use the Artix container's shutdown option, for example:
	it_container_admin -shutdown

Registering a Server with the Session Manager

For a server to use the session manager it must register itself with a running
session manager. Enabling a server to register itself with the session manager is
done through configuration. You do not have to write any special server code.
Once registered with a session manager, the services only accept client requests
that contain valid session headers. All clients that want to access the services
must be written to support session managed services.
Any server hosting services that are to be managed by the session manager must
load the session_endpoint_manager plug-in. The
Tour the poppion_ondpointo_nanagor prug in The
session_endpoint_manager enables the server to register with a running
session_endpoint_manager enables the server to register with a running

Configuring the server

Overview

Add the session_endpoint_manager to the plug-ins listed under the orb_plugins configuration entry within the configuration scope under which the server process runs. Example 4 shows the configuration scope of a server that hosts services managed by the session manager.

Example 4: Server Configuration Scope

```
session management {
. . .
 server
  {
   orb_plugins = ["xmlfile_log_stream", "wsdl_publish",
   "session_endpoint_manager"];
   plugins:session_endpoint_manager:default_group="SM_Demo";
 };
. . .
```

In this example, a server loaded into the server configuration scope is managed by the session manager at the location specified in your

session-manager.wsdl contract. Its endpoint manager comes up at the address specified in session-manager.wsdl. In this example, by default, all services instantiated by the server belong to the SM_Demo session manager group.

Using a copy of session-manager.wsdl

If you are using a copy of the default session manager contract to specify a fixed port, your server configuration must also specify the location of the contract. For example:

bus:initial_contract:url:sessionmanager =
 "c:\myapp/wsdl/session-manager.wsdl";

This is not necessary if you are using a dynamic port, or have updated the default contract with a fixed port. The Artix global scope bus:initial_contract:url:sessionmanager setting is used instead.

Server registration When a properly configured server starts up, it automatically registers with the session manager specified by the contract pointed to by bus:initial_contract:url:sessionmanager.

Configuring the Simple Policy Plug-in

Overview	The Artix session manager provides a simple policy callback plug-in (sm_simple_policy). This enables you to control the allowable duration for a session, and the maximum number of concurrent sessions allowed for each group.
Session properties	The simple policy plug-in provides default values for the following session properties:
	 Maximum number of concurrent sessions in a given group (default is 1). Minimum allowed timeout for a session (default is 1 second). Maximum allowed timeout for a session (default is 600 seconds). You can override these defaults using the following configuration variables:
	<pre>plugins:sm_simple_policy:max_concurrent_sessions plugins:sm_simple_policy:min_session_timeout plugins:sm_simple_policy:max_session_timeout</pre>
	All values must be non-negative. You must configure the max_session_timeout to be greater than or equal to min_session_timeout. A value of 0 means an unlimited timeout.
Implementing your own session management policies	The simple policy callback plug-in is an implementation of the Artix session manager's SessionManagementPolicyCallback interface. You can create your own session management policy by implementing this interface. For more detail, see "Implementing your own Policy Plug-In" on page 43.

Implementing your own Policy Plug-In

Overview	You can create your own session management policy plug-in by implementing the SessionManagementPolicyCallback interface and packaging it as a plug-in. This section explains how.
Procedure	To create your own session management policy plug-in complete the following steps:
	 Implement the SessionManagementPolicyCallback interface, shown in Example 5.
	Example 5: SessionManagementPolicyCallback Interface
	<pre>class SessionManagementPolicyCallback { public: virtual void begin_session(const IT_Bus::String& group, const IT_Bus::String& id, const IT_Bus::ULong& preferred_renew_timeout, IT_Bus::ULong& allocated_renew_timeout) IT_THROW_DECL((SessionCreationException)) = 0; virtual void renew_session(const IT_Bus::String& group, const IT_Bus::ULong& preferred_renew_timeout, IT_Bus::ULong& preferred_renew_timeout, IT_Bus::ULong& allocated_renew_timeout, IT_Bus::ULong& allocated_renew_timeout, IT_THROW_DECL((SessionRenewException)) = 0; virtual void end_session(const IT_Bus::String& group, const IT_Bu</pre>

The SessionManagementPolicyCallback interface is contained in the it_bus_services/session_manager_service.h header file.

- 2. Write a plug-in. For information on writing a plug-in, see the introductory chapters of the Developing Advanced Artix Plug-ins in C++ guide.
- 3. Integrate your session manager policy and your plug-in by registering your SessionManagementPolicyCallback implementation in your plug-in, as shown in Example 6.

Example 6: Registering your Session Management Policy

```
void
MySessionsPolicyBusPlugIn::bus_init(
) IT_THROW_DECL((Exception))
{
    Bus_ptr bus = get_bus();
    m_policy = new MySessionPolicy();
    SessionManagerService::register_policy_callback(bus,
    *m_policy);
}
void
MySessionsPolicyBusPlugIn::bus_shutdown(
) IT_THROW_DECL((Exception))
{
    SessionManagerService::deregister_policy_callback(get_bus());
}
```

The register and deregister policy static methods shown are contained in the it_bus_services/session_manager_service.h header file.

4. Deploy your session management policy plug-in with the session manager by listing it in the same orb_plugins list as the session manager service, and by providing Artix with the root name of the plug-in library, as shown in Example 7 on page 45.

Example 7: Deploying your Session Management Policy Plug-in

```
# Artix domain configuration file
session_management {
    ...
    sm_service{
        orb_plugins = ["xmlfile_log_stream",
        "session_manager_service", "my_policy_plugin_name"];
plugins:my_policy_plugin_name:shlib_name="root_library_name"
};
```

Now when the session manager receives requests for new sessions, your session management policy implementation will be consulted.

Fault Tolerance

Overview	 Enterprise deployments demand that applications can cleanly recover from occasional failures. The Artix session manager is designed to recover from the two most common failures: Failure of a registered endpoint. Failure of the session manager itself.
Endpoint failure	When an endpoint gracefully shuts down, it notifies the session manager that it is no longer available. The session manager removes the endpoint from its list so it can not give a client a reference to a dead endpoint. However, when an endpoint fails unexpectedly, it cannot notify the session manager and the session manager can unknowingly give a client an invalid reference causing the failure to cascade.
	To decrease the risk of passing invalid references to clients, the session manager occasionally pings all of its registered endpoint managers to see if they are still running. If an endpoint manager does not respond to a ping, the session manager removes that endpoint manager's references.
	You can adjust the interval between session manager pings by setting the plugins:session_manager:peer_timeout configuration variable. The default setting is 4 seconds. For more information, see the Artix Configuration Reference, C++ Runtime.
Service failure	If the session manager fails, all of the references to the registered services are lost and the active services are no longer registered. After the session manager misses its ping interval, the endpoint managers periodically attempt to reregister with the session manager until they are successful. This ensures that the active services reregister with the session manager when it restarts.
	You can adjust the interval between the endpoint manager's pings of the session manager by setting the configuration variable plugins:session_endpoint_manager:peer_timeout. The default setting is 4 seconds. For more information, see the Artix Configuration Reference, C++ Runtime.

Adding SOAP 1.2 Support

Overview	The default session-manager.wsdl file shipped with Artix contains a SOAP 1.1 binding and a SOAP 1.1 service. As of release 4.1, Artix supports SOAP 1.2 bindings as well.
	If your site requires the use of SOAP 1.2 bindings for communication with the session manager, follow these steps:
	1. Make a copy of the default session-manager.wsdl file.
	 Edit your copy to include a SOAP 1.2 binding. See the SOAP 1.2 chapter of Bindings and Transports, C++ Runtime for guidelines on adding a SOAP 1.2 binding.
	3. Use the bus:initial_contract:url configuration variable to point to the location of your edited session-manager.wsdl file, or use one of several WSDL publishing methods described in "Accessing Contracts and References" in Configuring and Deploying Artix Solutions, C++ Runtime.
	For SOAP 1.2 both the session manager and the session endpoint manager need to be updated to a SOAP 1.2 binding; for example:
	<pre>bus:initial_contract:url:sessionmanager = "session-manager12.wsdl";</pre>
	<pre>bus:initial_contract:url:sessionendpointmanager = "session-manager12.wsdl";</pre>
SOAP 1.2 considerations	The SOAP 1.2 binding in Artix 4.1 (or higher) supports endpoint references (EPRs) only in the format defined by the WS-Addressing standard, and no longer supports the deprecated proprietary Artix references. Artix's SOAP 1.1 binding supports both EPRs and the Artix references used by Artix 3.0 and earlier.

This means that an Artix 4.1 (or higher) session manager that uses the SOAP 1.2 binding cannot support connections from Artix 4.0 and 3.0 clients, because those versions of Artix do not support SOAP 1.2. Thus, when defining your Artix 4.1 (or higher) session manager, if your site intends to maintain backward compatibility with Artix 4.0 and Artix 3.0 clients, do not also use a SOAP 1.2 binding. The configuration step described in "Artix 4.1 and 4.2 session manager setup for backward compatibility" on page 60 is not compatible with a SOAP 1.2 binding.

CHAPTER 3

Using the Session Manager from an Artix Client

Clients that want to use the Artix session manager must include code dedicated to that task. This chapter outlines how to write an Artix session manager client and in C++. In addition, it describes migration scenarios that deal with how to best migrate Artix 3.x applications to Artix 4 or higher.

In this chapter

This chapter discusses the following topics:

Implementing a C++ Client	page 50
Migrating from Earlier Versions	page 58

Implementing a C++ Client

Overview	Clients that want to make requests on session managed services must be designed explicitly to interact with the Artix session manager and must pass session headers to the session managed services. This section describes how to write a session manager client in C++.	
Demonstration code	The code examples in this section are taken from the session manager demo's $C++$ client code. The $C++$ client makes a request on a business service that is managed by the Artix session manager. The complete client code can be found in the following directory of your Artix installation:	
	InstallDir/samples/advanced/session_management/ cxx/client	
Implementing a C++ session client	t There are eight steps a client takes when making requests on a session manage service. They are:	
	1. Instantiate a proxy for the session management service.	
	 Start a session for the desired service's group using the session manager proxy. 	
	 Obtain the list of endpoints available in the group. 	
	 Create a service proxy from one of the endpoints in the group. 	
	 Build a session header to pass to the service. 	
	 Invoke requests on the endpoint using the proxy. 	
	 Renew the session as needed. 	
	8. End the session using the session manager proxy when finished with the services.	
Instantiating a proxy	Before a client can request a session from the session manager, it must create a proxy to forward requests to the running session manager. To do this the client creates an instance of SessionManagerClient using the session manager's contract name, session-manager.wsdl.	

Example 8 shows the C++ code for instantiating a session manager proxy.

Example 8: *Instantiating a Session Manager Proxy*—*C*++

```
// C++
SessionManagerClient session_mgr;
SessionManagerClient* session_mgr_ptr = &session_mgr;
```

Start a session

After instantiating a session manager proxy, a client can then start a session for the desired service's group using the session manager's beginSession() function. The beginSession() function has the following signature:

```
// C++
virtual void
beginSession(
    const IT_Bus::String &endpoint_group,
    const IT_Bus::ULong preferred_renew_timeout,
    SessionInfo &session_info
) IT_THROW_DECL((IT_Bus::Exception)) = 0;
```

The beginSession() function takes the following input parameters:

- endpoint_group—the endpoint group name, which corresponds to the default group name set in the server's configuration scope as described in "Registering a Server with the Session Manager" on page 40.
- preferred_renew_timeout—the preferred session duration in seconds. If the specified duration is less than the value specified by the session manager's min_session_timeout configuration setting, it will be set to the configured minimum value. If the specified duration is higher than the value specified by the session manager's max_session_timeout configuration setting, it will be set to the configured max value.

And the following output parameter:

 session_info—a sequence complex type that contains the session id, session_id, and the actual assigned session duration, renew_timeout. Example 9 shows the C++ client code to begin a session for the SM_Demo group.

Example 9: *Beginning a Session*—*C*++

```
// C++
...
IT_Bus_Services::IT_SessionManager::SessionId group_session;
int
main(int argc, char* argv[])
{
    ...
    // Begin a session
    session_mgr.beginSession("SM_Demo", 20, session_info);
    cout << "Begin session invoked" << endl;
    // Retrieve the session ID from the response
    group_session = session_info.getsession_id();
    cout << "Got session!" << endl << endl;
    ...
}</pre>
```

Get a list of endpoints in the group

The session manager hands out sessions for a group of services. To get an individual service on which the client can make requests, the client needs to get a list of the services in the group. The session manager proxy's getAllServiceEndpoints() function returns a list of all endpoints registered to the specified group. The getAllServiceEndpoints() function has the following signature:

```
// C++
virtual void
getAllServiceEndpoints(
    const SessionId &session_id,
    ServiceEndpointList &endpoints
) IT_THROW_DECL((IT_Bus::Exception)) = 0;
```

The getAllServiceEndpoints() function takes the following input parameter:

 session_id—the session ID for which you are requesting services (obtained in the previous step).

And the following output parameter:

 endpoints—the list of services available. If the group has no services, the list will be empty. Example 10 shows the C++ code for getting the list of services in a group.

Example 10: *Retrieving the List of Services in a Group*—*C*++

	//C++
	// Get the endpoints for the session.
	IT_Bus_Services::IT_SessionManager::ServiceEndpointList
	endpoint_list;
	// Must provide the session ID
	// Without a valid session ID, the session manager will refuse
	// the request
	session_mgr.getAllServiceEndpoints(
	group_session,
	endpoint_list
);
Create a proxy for the requested	The client can use any of the services returned by getAllServiceEndpoints()
service	to instantiate a service proxy.
	to instantiate a service proxy.
	The session manager returns the services in the order the services registered with
	the session manager. Clients are, therefore, responsible for circulating through
	the list. Otherwise they will all make requests on only one service in the group.
	In addition, because the session manager does not force all members of a group
	to implement the same interface, you might need to have your clients to check
	each service to see if it implements the correct interface by checking the
	each service to see if it implements the correct interface by checking the
	each service to see if it implements the correct interface by checking the reference's service name as shown in Example 11 on page 54.

Example 11: *Checking the Service Reference for its Interface*—*C*++

```
//C++
#include <it_bus/wsaddressing_util.h>
using namespace WS_Addressing;
EndpointReferenceType& endpoint = endpoint_list[0];
QName service_name =
   EndpointReferenceUtil::get_service_qname(endpoint);
if (service_name == "", "SOAPService",
   "http://www.iona.com/session_management")
{
   // Instantiate a SOAPService proxy
}
else
{
   // do something else
}
```

Example 12 shows the client code for creating a GreeterClient proxy from an endpoint reference.

Example 12: *Instantiate a Proxy Server*—*C*++

```
// C++
GreeterClient client(endpoint_list[0], bus);
```

Create a session header

Services that are being managed by the session manager will only accept requests that include a valid session header. Example 13 shows how to send the session ID in a header by initializing the sessionIDContext header context.

Example 13: *Initialize the sessionIDContext Header Context*—*C*++

```
// C++
using namespace session_management;
using namespace IT_Bus;
using namespace IT_Bus_Services::IT_SessionManager;
```

Example 13: *Initialize the sessionIDContext Header Context*—*C*++

```
. . .
const QName DEMO_SESSION_ID_CONTEXT_NAME(
    "",
    "sessionIDContext",
    "http://ws.iona.com/sessionmanager"
);
. . .
// The session name and session group must be added to each
// request Without valid entries, the session endpoint manager
// will reject the request
ContextRegistry* registry = bus->get_context_registry();
ContextCurrent& current = registry->get_current();
ContextContainer* request_contexts = current.request_contexts();
AnyType* attr = request_contexts->get_context(
    DEMO_SESSION_ID_CONTEXT_NAME,
    true
);
if (0 == attr)
{
    cerr << endl << "Error : Unable to access Session Context"
        << endl:
    return -1;
}
SessionId* session_attr = dynamic_cast<SessionId*> (attr);
if (0 == session attr)
{
    cerr << endl << "Error : Unable to cast Session Context"
        << endl;
    return -1;
}
session attr->setname(group session.getname());
session_attr->setendpoint_group(
    group_session.getendpoint_group()
);
```

For more details about the context API used in this example, see the *Artix Contexts* chapter of the Developing Artix Applications in C++ guide.

Make requests on service proxy	Once the session information is added to the proxy's port information, the client can invoke operations on the endpoint as it would a non-managed service. If the endpoint rejects the request because the client's session is not valid, an exception is raised.
Renewing a session	If a client is going to use a session for a longer than the duration the session was granted, the client must renew its session or the session will timeout. A session is renewed using the session manager proxy's renewSession() function. The renewSession() function has the following signature:
	<pre>// C++ virtual void renewSession(const SessionInfo &session_info, IT_Bus::ULong &renew_timeout) IT_THROW_DECL((IT_Bus::Exception)) = 0;</pre>
	The renewSession() function takes the following input parameter:
	 session_info—a sequence complex type that contains the session id, session_id, and the preferred session duration, renew_timeout.
	And the following output parameter
	• renew_timeout—the actual assigned session duration, in seconds.
	If the renewal is unsuccessful, an IT_Bus_Services::renewSessionFaultException is raised.
End the session	When a client is finished with a session managed service, it should explicitly end its session. This ensures that the session is freed up immediately. A session is ended using the session manager proxy's endSession() function. The endSession() function has the following signature:
	<pre>// C++ virtual void endSession(const SessionId &session_id) IT_THROW_DECL((IT_Bus::Exception)) = 0;</pre>
	Example 14 on page 57 shows how to end a session.

Example 14: *Ending a Session*—*C*++

//C++

cout << "Ending session" << endl; session_mgr.endSession(group_session);

Migrating from Earlier Versions

Overview With the release of Artix 4.0 and subsequent releases, the following changes might affect any existing Artix applications: Session manager API name changes were made in compliance with the wrapped doc-literal convention. Artix switched from using a proprietary reference format to using the standard WS_Addressing endpoint reference format. If you have existing applications that use the old session manager APIs and the old proprietary reference format, you might want to consider migrating those applications to use the new APIs and WS_Addressing. For WS Addressing migration information, see the Endpoint References chapter in the Developing Artix Application in C++ guide. This section describes the session manager API migration scenarios. New session manager API Artix 4.0 and subsequent releases include a new version of the session-manager.wsdl file. The operations contained in this new WSDL file conform with the wrapped doc-literal convention. Specifically: The begin_session() operation has been replaced with beginSession(). The end_session() operation has been replaced with endSession(). The renew_session() operation has been replaced with renewSession(). The get_all_endpoints() operation has been replaced with getAllServiceEndpoints(). The get_all_endpoint() operation returns an EndpointList of old style References. The getAllServiceEndpoints() operation returns a ServiceEndpointList

The new session-manager.wsdl file is located in the following directory of your Artix installation:

of WS-Addressing type EndpointReferenceType.

InstallDir/wsdl

In Artix 4.0 and subsequent releases, by default, the session manager resolves its service contract against this session-manager.wsdl file and, therefore, supports the new API. The default Artix configuration file, artix.cfg, points to the new session manager WSDL file as follows:

bus:initial_contract:url:sessionmanager =
 "InstallDir/wsdl/session-manager.wsdl";

Migrating to new session manager APIs

If you have an existing application that you want to migrate to Artix 4.0 or higher, you can switch to using the new APIs by changing the following aspects of your application:

- Replace begin_session() with beginSession()
- Replace end_session() with endSession()
- Replace renew_session() with renewSession()
- Replace get_all_endpoints() with getAllServiceEndpoints()

Using a mixture of old and new session manager APIs

Artix 4.0 and subsequent releases include a second session-manager.wsdl file that supports both the old and the new APIs. To use the session manager with Artix 3 clients, you must start the session manager with this session-manager.wsdl file. It is located in the following directory of your Artix installation:

InstallDir\wsdl\oldversion

You can configure the session manager to use this session-manager.wsdl file by setting the bus:initial_contract:url:sessionmanager configuration variable as follows:

bus:initial_contract:url:sessionmanager =
 "InstallDir/wsdl/oldversion/
 session-manager.wsdl";

Alternatively, you can set it as a command-line argument when launching a server:

```
-BUSservice_contract
InstallDir/wsdl/oldversion/session-manager.wsdl
```

Note: The session manager and the endpoints it manages are tightly coupled and, therefore, must be the same version.

Artix 4.1 and 4.2 session manager setup for backward compatibility

The artix.cfg file included with Artix 4.1, 4.2 and higher has a new configuration entry, bus:non_compliant_epr_format. The default artix.cfg sets this entry by default to "false". This setting allows for greater interoperability between Artix and Web services software from other vendors.

If your site uses a session manager, session manager enabled services, and session manager enabled clients all built with Artix 4.1 or higher, then no further configuration is necessary.

If your site uses a session manager build with Artix 4.1 or higher, with services and clients from Artix 4.0 and 3.0.x, then you must add one configuration entry in your Artix configuration. Add the line to the

session_management.sm_service scope of the configuration file that controls
your instance of the session manager. The line to add is:

bus:non_compliant_epr_format = "true";

Note: The session manager demos that ship with Artix 4.1, 4.2 and higher do not have this line added to their session_management.cfg files.

For example, the following configuration file extract shows an edited session_management.cfg file for the primary session manager demo that allows Artix 3.x and 4.0 clients to connect to and use an Artix 4.1 or higher session manager:

```
demos {
 session_management {
 plugins:xmlfile_log_stream:use_pid = "true";
 client
  {
    orb_plugins = ["xmlfile_log_stream"];
  };
  sm service
  {
   bus:initial_contract:url:sessionmanager =
   "../../etc/session-manager.wsdl";
   plugins:sm_simple_policy:max_concurrent_sessions = "1";
    plugins:sm_simple_policy:min_session_timeout = "1";
    plugins:sm_simple_policy:max_session_timeout = "600";
    orb_plugins = ["xmlfile_log_stream", "wsdl_publish",
   "session_manager_service", "sm_simple_policy"];
   bus:non_compliant_epr_format = "true";
 };
  server
  {
   orb_plugins = ["xmlfile_log_stream",
   "session_endpoint_manager"];
  bus:initial_contract:url:sessionmanager =
   "../../etc/session-manager.wsdl";
    plugins:session_endpoint_manager:default_group = "SM_Demo";
 };
};
};
```

Disabling session manager support for Artix 3

When you have all Artix client applications migrated to Artix 4 or higher, the backward compatibility feature of the Artix 4 session manager is no longer necessary for your site. However, there is no need to disable the backward compatibility feature, and the Artix 4 or higher session manager performance is not improved by disabling backward compatibility.

If you prefer to disable this feature, you can use a local configuration scope to override the Artix root configuration. In your local scope, set the WSDL path to empty for the Artix 3-compatible version of the session manager, using a line like the following:

bus:qname_alias:sessionmanager_oldversion = "";

CHAPTER 4

Using the Session Manager from a non-Artix Client

Non-Artix clients can also use the session manager to make requests on managed services. This chapter outlines how to implement a .NET client and an Axis client.

In this chapter

This chapter discusses the following topics:

Implementing a .NET Client	page 64
Implementing an Axis Client	page 69

Implementing a .NET Client

Overvi	
Overvi	ew

.NET clients can use the session manager to make requests on managed services, using the Bus.Services.dll library. This is because the Artix session manager uses SOAP headers to pass session tokens between clients and services. The session manager also has a number of methods for managing active sessions. The Artix .Net plug-in is Web Services Enhancements 2.0 (WSE 2.0) compliant. Users can enable session by constructing a session filter and appending it to a SOAP output filter using WSE 2.0 APIs. The helper classes included in the Bus.Services library simplify working with the session manager by providing native .Net calls to access the session manager. They also handle session renewal and attaching session headers to outgoing requests.

What you need before starting

Demonstration code

Before starting to develop a client that uses the Artix session manager you need:

- A means for contacting a deployed Artix session manager. This can be one of the following:
 - An Artix reference
 - An HTTP address
 - A local copy of the session manager WSDL contract
- A locally accessible copy of the WSDL contract that defines the service that you want the client to invoke upon.
- To install WSE 2.0 SP3 before starting an Artix .NET session manager client.

The code examples in this section are taken from the session manager demo's .NET client code. The .NET client makes a request on a business service that is managed by the Artix session manager. The complete client code can be found in the following directory of your Artix installation:

InstallDir\samples\advanced\session_management\ dotnet\client

Procedure

To develop a .Net client that uses the Artix session manager do the following:

- 1. Create a new project in Visual Studio.
- 2. Right-click the folder for you new project and select **Add Reference** from the pop-up menu.
- 3. Click Browse on Add Reference window.
- 4. In the file selection window browse to your Artix installation and select the Bus.Services.dll from the *InstallDir*\utils\.NET directory.
- 5. Click OK to return to the Visual Studio editing area.
- 6. Right-click the folder for your new project and select **Add Web Reference** from the pop-up menu.
- 7. In the **Address:** field of the browser, enter the full pathname of the contract for the service on which you are going to make requests.
- 8. Click Add Reference to return to the Visual Studio editing area.
- 9. Open the .cs file generated for the contract you imported.
- Locate the class declaration for the service on which you intend to make requests. The class declaration will look similar to that shown in Example 15.

Example 15: .Net Service Proxy Class Declaration

public class SOAPService :
 System.Web.Services.Protocols.SoapHttpClientProtocol {

11. Change the class' base type from

System.Web.Services.Protocols.SoapHttpClientProtocol to Microsoft.Web.Services2.WebServicesClientProtocol. The resulting class declaration will look similar to that shown in Example 16.

Example 16: .Net Session Managed Proxy Class Declaration

public class SOAPService : Microsoft.Web.Services2.WebServicesClientProtocol {

Reassigning the service proxy class to the Artix specific base class adds methods to the proxy that allow it to work with the session manager.

12. Add a new C# class to your project.

- Add the statement using Bus.Services; after the statement using System;.
- Create a service proxy for the Artix session manager by instantiating an instance of the Bus.Services.SessionManager class as shown in Example 17.

Example 17: Instantiating a Session Manager Proxy in .Net

SessionManager sessionManager = new SessionManager ("http://localhost:9007/services/sessionManagement/ sessionManagerService");

The constructor's parameter is the HTTP address of a deployed session manager. The SessionManager class also has a construct that takes an Artix reference for use with the Artix locator.

15. Create a new Artix session by instantiating an instance of Bus.Services.Session as shown in Example 18.

Example 18: Creating a New Session

Session session = new Session(sessionManager, "SM_Demo", 20);

The constructor takes three parameters:

- An instantiated SessionManager object.
- A string identifying the group for which the client wants a session; in this example, the group name is SM_Demo.
- The default timeout value, in seconds, for the session.

Once the session is created, the session will automatically attempt to renew itself until the session is closed. The client does not need to worry about renewing the session.

16. Get a list of the references for the endpoints that are in the session's group using the SessionManager.get_all_endpoints() function as shown in Example 19.

Example 19: Getting the Endpoint References

```
Bus.Services.Types.EndpointReferenceType[] refs =
    sessionManager.getAllServiceEndpoints(sessionId);
```

The get_all_endpoints() function takes the session ID of the session and returns an array of Artix references. Each entry in the array contains the endpoint of one member of the group for which the session was requested.

- 17. Create a .Net proxy for the service on which you are going to make requests as you normally would.
- Change the value of the proxy's .Url member to the SOAP address of one of the Artix references returned from the session manager as shown in Example 20.

Example 20: Changing the URL of a .Net Service Proxy to Use a Reference

simpleService.Url = refs[0].Address.Value;

How you determine which member of the returned array contains the desired endpoint is an implementation detail beyond the scope of this discussion.

 Instruct the proxy to include the session header in all of its requests by adding a session filter on the proxy output SOAP filters as shown in Example 21.

Example 21: Setting a Proxy's Session Header

```
simpleService.Pipeline.OutputFilters.Add(new
Bus.Services.SessionFilter(session));
```

Once you have made the above call, all requests made by the proxy will contain an Artix session header. The session manager uses the session header to validate the client's requests against the list of valid sessions.

- 20. Make requests on the service as you would normally.
- 21. When you are done with the service, end the session by calling EndSession() on the session object, as shown in Example 22:

Example 22: Ending a Session

session.EndSession()

Note: For a complete list of available classes and methods, see the docs.xml file, which is generated during the Bus.Services build. It is available in the following directory of your Artix installation:

InstallDir\utils\.NET

Implementing an Axis Client

Overview	An Axis client can use the session manager to invoke on managed services. The Artix session manager uses SOAP headers to pass session tokens between clients and services. Therefore, when writing an Axis client, you must insert session tokens into SOAP headers programmatically in order to invoke on services managed by session manger.
Demonstration code	The code examples in this section are taken from the session manager demo's Axis client code. The Axis client makes a request on a business service that is managed by the Artix session manager. The complete client code can be found in the following directory of your Artix installation:
	InstallDir/samples/advanced/session_management/axis/ client
Axis version	Axis version 1.3 is used in the demo.
Procedure	To develop an Axis client that uses Artix session manager do the following: 1. Generate Axis stub code from the Artix session manager WSDL file as
	shown in Example 23:
	Example 23: Generating Axis Stub Code for Session Manager
	Java org.apache.axis.wsdl.WSDL2Java\etc\session-manager.wsdl
	The session-manager.wsdl file is available in the following directory of your Artix installation:

InstallDir/wsdl

2. Generate Axis stub code from the WSDL file for the service on which you want your client to invoke, as shown in Example 24:

Example 24: Generating Axis Stub Code for the Target Web Service

```
Java org.apache.axis.wsdl.WSDL2Java ..\etc\session_management.wsdl
```

In this example, the session_management.wsdl file is part of the session manager demo and describes the business service on which the client ultimately invokes. It is available in the following directory of your Artix installation:

InstallDir/samples/advanced/session_management/etc

3. Retrieve a session manager service endpoint as shown in Example 25:

Example 25: Retrieving a Session Manager Service Endpoint

```
java.lang.String url =
   get_soap_address("../etc/session-manager.wsdl", service,
   port);
java.net.URL endpoint = new java.net.URL(url);
```

4. Instantiate a session manager proxy as shown in Example 26:

Example 26: Instantiating a Session Manager Proxy

```
SessionManagerService smsl = new SessionManagerServiceLocator();
SessionManagerBindingStub sm_binding =
  (SessionManagerBindingStub)smsl.getSessionManagerPort
  (endpoint);
```

5. Start a new session as shown in Example 27:

Example 27: Starting a Session

```
SessionInfo session_response = null;
session_response = sm_binding.beginSession("SM_Demo", new
org.apache.axis.types.UnsignedLong(20));
```

6. Retrieve the session ID and all the endpoints as shown in Example 28:

Example 28: Retrieving a Session ID and the Endpoints

```
SessionId session_id = session_response.getSession_id();
EndpointReferenceType[] endpoints =
   sm_binding.getAllServiceEndpoints(session_id);
```

7. Retrieve the first endpoint as shown in Example 29:

Example 29: Retrieving the Business Service Endpoint

```
EndpointReferenceType epr_ref = endpoints[0];
String url = epr_ref.getAddress().get_value().toString();
java.net.URL simple_endpoint = new java.net.URL(url);
```

 Insert the session ID into the SOAP header of the Axis client request as shown in Example 30:

Example 30: Inserting the Session ID into the Axis Client Request SOAP Header

```
String ns = "http://ws.iona.com/sessionmanager";
header = new org.apache.axis.message.SOAPHeaderElement(ns, "id",
    session_response.getSession_id());
proper_call.addHeader(header);
```

You must insert the session context into the SOAP header programmatically for each invocation. Otherwise, the invocation will fail.

9. Invoke on the endpoint, as shown in Example 31:

Example 31: Invoking on the Business Service

```
String _return = (String)proper_call.invoke(new
java.lang.Object[] {});
```

10. End the session, as shown in Example 32:

Example 32: Ending the Session

sm_binding.endSession(session_id);

CHAPTER 4 | Using the Session Manager from a non-Artix Client
