Documentation updates

The title page of this document contains the following identifying information:

- Software Version number, which indicates the software version.
- Document Release Date, which changes each time the document is updated.
- Software Release Date, which indicates the release date of this version of the software.

To verify you are using the most recent edition of a document, go to

<https://softwaresupport.softwaregrp.com/group/softwaresupport/search-result?doctype=online help>.

This site requires you to sign in with a Software Passport. You can register for a Passport through a link on the site.

You will also receive updated or new editions if you subscribe to the appropriate product support service. Contact your Micro Focus sales representative for details.

Support

Visit the Micro Focus Software Support Online website at <https://softwaresupport.softwaregrp.com>.

This website provides contact information and details about the products, services, and support that Micro Focus offers.

Micro Focus online support provides customer self-solve capabilities. It provides a fast and efficient way to access interactive technical support tools needed to manage your business. As a valued support customer, you can benefit by using the support website to:

- Search for knowledge documents of interest
- Submit and track support cases and enhancement requests
- Access the Software Licenses and Downloads portal
- Download software patches
- Access product documentation
- Manage support contracts

- Look up Micro Focus support contacts
- Review information about available services
- Enter into discussions with other software customers
- Research and register for software training

Most of the support areas require you to register as a Passport user and sign in. Many also require a support contract.

You can register for a Software Passport through a link on the Software Support Online site.

To find more information about access levels, go to

<https://softwaresupport.softwaregrp.com/web/softwaresupport/access-levels>.

Part I: Overview of HTML Export

This section provides an overview of the Micro Focus IDOL KeyView Export SDK and describes how to use the C and COM implementations of the API.

- [Introducing HTML Export, on page 16](#)
- [Getting Started, on page 27](#)

Chapter 1: Introducing HTML Export

This guide is for developers who incorporate the Micro Focus KeyView HTML conversion technology into their custom web applications using a C or COM development environment. It is intended for readers who are familiar with HTML, C, and/or COM.

This section describes the KeyView Export SDK package.

• Overview	16
• Features	16
• Platforms, Compilers, and Dependencies	17
• Windows Installation	19
• UNIX Installation	20
• Package Contents	21
• License Information	22
• Directory Structure	23
• Definition of Terms	25

Overview

HTML Export is part of the KeyView Export SDK. It enables you to convert virtually any document, spreadsheet, presentation, or graphic into high-fidelity HTML. Incorporating this technology into your web-based applications enables your end-users to access a document even if they do not have the appropriate plug-in or native application. With HTML Export, you control the content, structure, and format of the HTML output using either easily customized templates, or the flexible and robust APIs.

Export SDK supports a number of programming environments, such as Visual Basic, Java, .NET, and Delphi and runs on all popular operating system platforms including Windows, Solaris, HP-UX, IBM AIX, and Linux.

Export SDK is part of the KeyView suite of products. KeyView provides high-speed text extraction, conversion to web-ready HTML and well-formed XML, and high-fidelity document viewing.

Features

- Dynamically convert word processing, spreadsheet, presentation, and graphics files into web-ready, 4.0-compliant HTML.
- Export supports over 300 formats in 70 languages.
- Convert files either in-process or out of process. Out-of-process conversion ensures the stability and robustness of the calling application if a corrupt document causes an exception or causes the conversion process to fail.
- You can extract files embedded within files by using the File Extraction API, and then convert them by using the Export API.

- Use redirected input/output. You can provide an input stream that is not restricted to file system access.
- Export automatically recognizes the file format being converted and uses the appropriate reader. Your application does not need to rely on file name extensions to determine the file format.
- Create heading levels in the output file either by using the structure in the source document or by allowing Export to automatically generate a structure based on document properties, such as font or font attributes.
- Use callbacks to control aspects of the conversion process, such as file naming and the insertion of scripts.
- Manage memory allocation to optimize speed and performance of application.
- Insert predefined HTML markup at specific points in the output stream.
- Create navigable documents by automatically inserting links into target HTML. You can also break large documents into multiple linked web pages.
- Apply Cascading Style Sheets (CSS) to improve the fidelity of the output.
- Map paragraph and character styles in word processing documents to any markup that you specify in the output.
- Control the resolution of rasterized vector graphics to optimize storage requirements or image quality.
- Select the target format for converted graphics, including GIF, JPEG, CGM, PNG, WMF, and Java on Windows, and Java and JPEG on Unix and Linux.
- Define the background, colors, and fonts used in the final HTML document, or maintain the source document's existing attributes.

Platforms, Compilers, and Dependencies

This section lists the supported platforms, supported compilers, and software dependencies for the KeyView software.

Supported Platforms

- CentOS 7
- FreeBSD 8.1 x86
- IBM AIX L6.1 PowerPC 32-bit and 64-bit
- IBM AIX L7.1 PowerPC 32-bit and 64-bit
- Mac OS X Mountain Lion 10.8 or higher on 32- and 64-bit Apple-Intel architecture
- Microsoft Windows Vista Business Edition x86 and x64. Other editions of Vista have not been tested, but are likely supported.
- Microsoft Windows 2008 Server Enterprise Edition x86 and x64
- Microsoft Windows 2008 Server R2
- Microsoft Windows 7 x86 and x64
- Microsoft Windows 8 x86 and x64
- Oracle Solaris 10 SPARC

- Oracle Solaris 10 x86 and x64
- Red Hat Enterprise Linux 5.0 x86 and x64
- Red Hat Enterprise Linux 6.0 x86 and x64
- SuSE Linux Enterprise Server 10, 10.1, 11, x86 and x64

Supported Compilers

Platform	Architecture	Compiler Name	Compiler Version
Microsoft Windows	x86	cl	Microsoft 32-bit C/C++ Optimizing Compiler Version 16.00.30319.01 for x86
	x64	cl	Microsoft C/C++ Optimizing Compiler Version 16.00.30319.01 for x64
Sun Solaris	x86 64-bit	Sun Studio 12	Sun C 5.9 SunOS_i386 Patch 124868-01 2007/07/12
	SPARC 64-bit	Sun Studio 11	Sun C 5.8 Patch 121015-06 2007/10/03
Linux	x86	gcc / g++	3.4.3 (Redhat 4), 4.1.0 (SuSE Linux 10)
	x64	gcc / g++	4.1.0 (Redhat 4), 4.1.0 (SuSE Linux 10)
IBM AIX	Power	xLC_r / cc_r	IBM XL C/C++ Enterprise Edition V8.0
Mac OSX	Apple-Intel 32-bit and 64-bit	LLVM	Apple LLVM 5.1 (clang-503.0.40) (based on LLVM 3.4svn)
FreeBSD	BSD x86	gcc / g++	4.2.1 [FreeBSD] 20070719

Supported Compilers for Java and .NET Components

Component	Compiler
Java components	Java 1.5
.NET components	Microsoft Visual J# 2005 Compiler 8.00.50727.42

C++ Filter SDK

The C++ Filter SDK is supported on:

- Linux using GCC 5 or later
- Windows using Visual Studio 2015 or later

Software Dependencies

Some KeyView components require specific third-party software:

- Java Runtime Environment (JRE) or Java Software Developer Kit (JDK) version 1.5 is required for Java API and graphics conversion in Export SDK.
- Outlook 2002 client or later versions is required when processing Microsoft Outlook Personal Folders (PST) files using the MAPI-based reader (`pstsr`). The native PST reader (`pstnsr`) does not require an Outlook client.

NOTE:

If you are using 32-bit KeyView, you must install 32-bit Outlook. If you are using 64-bit KeyView, you must install 64-bit Outlook.

If the bit editions do not match, an error message from Microsoft Office Outlook is displayed:

Either there is a no default mail client or the current mail client cannot fulfill the messaging request. Please run Microsoft Outlook and set it as the default mail client.

Additionally, KeyView displays the following return code:

Error 32: KVErrror_PSTAccessFailed.

- Lotus Notes or Lotus Domino is required for Lotus Notes database (NSF) file processing. The minimum requirement is 6.5.1, but version 8.5 is recommended.
- Microsoft .NET Framework SDK version 2.0, Microsoft .NET Framework version 2.0 Redistributable Package is required if you are programming in a .NET environment.
- Microsoft Visual C++ 2013 and Microsoft Visual C++ 2010 Redistributables (Windows only).

Windows Installation

To install the SDK on Windows, use the following procedure.

To install the SDK

1. Run the installation program, `KeyViewProductNameSDK_VersionNumber_OS.exe`, where *ProductName* is the name of the product, *VersionNumber* is the product version number, and *OS* is the operating system.

For example:

`KeyViewExportSDK_11.6_Windows_X86_64.exe`

The installation wizard opens.

2. Read the instructions and click **Next**.
The License Agreement page opens.
3. Read the agreement. If you agree to the terms, click **I accept the agreement**, and then click

Next.

The Installation Directory page opens.

4. Select the directory in which to install the SDK. To specify a directory other than the default, click

, and then specify another directory. After choosing where to install the SDK, click **Next**.

The License Key page opens.

5. Type the company name and license key that were provided when you purchased KeyView, and then click **Next**.
 - The company name is case sensitive.
 - The license key is a string that contains 31 characters.

NOTE:

The installation program validates the company name and license key and generates the file *install\OS\bin\kv.lic* (where *install* is your chosen installation folder and *OS* is the name of the operating system platform). The license information is validated when the KeyView API is used. If you do not enter a license key at this step, or if you enter invalid information, the KeyView SDK is installed, but the API does not function. When you obtain a valid license key, you can either re-install the KeyView SDK, or manually update the license key file (*kv.lic*) with the new information. For more information, see [License Information, on page 22](#).

The Pre-Installation Summary dialog box opens.

6. Review the settings, and then click **Next**.

The SDK is installed.

7. Click **Finish**.

UNIX Installation

To install the SDK, use one of the following procedures.

To install the SDK from the graphical interface

- Run the installation program and follow the on-screen instructions.

To install the SDK from the console

1. Run the installation program from the console as follows:

```
./KeyViewExportSDK_VersionNumber_Platform.exe --mode text
```

where:

VersionNumber is the product version.

Platform is the name of the platform.

2. Read the welcome message and instructions and press `Enter`.

The first page of the license agreement is displayed.

3. Read the license information, pressing `Enter` to continue through the text. After you finish reading

the text, and if you accept the agreement, type **Y** and press **Enter**.

You are asked to choose an installation folder.

4. Type an absolute path or press **Enter** to accept the default location.

You are asked for license information.

5. At the **Company Name** prompt, type the company name that was provided when you purchased KeyView, and then press **Enter**. The company name is case sensitive.
6. At the **License Key** prompt, type the license key that was provided when you purchased KeyView, and then press **Enter**. The license key is a string that contains 31 characters.

NOTE:

The installation program generates the file `install\OS\bin\kv.lic` (where `install` is your chosen installation folder and `OS` is the name of the operating system platform). The license information is validated when the KeyView API is used. If you do not enter a license key at this step, or if you enter invalid information, the KeyView SDK is installed but the API does not function. When you obtain a valid license key, you can either re-install the KeyView SDK, or manually update the license key file (`kv.lic`) with the new information. For more information, see [License Information, on the next page](#).

The Pre-Installation summary is displayed.

7. If you are satisfied with the information displayed in the summary, press **Enter**.

The SDK is installed.

Package Contents

The Export installation contains:

- Libraries and executable files necessary for converting source documents into high-quality, web-ready HTML (see [Files Required for Redistribution, on page 385](#)).
- The include files that define the functions and structures used by the application to establish an interface with Export:
`adinfo.h`
`kvhtml.h`
`kvtypes.h`
`kvxtract.h`
- The Java API implemented in the `com.verity.api.export` package contained in the `KeyView.jar` file.
- Several sample programs that demonstrate Export's functionality.
- Sample images that can be used as navigation buttons and background textures in your output.
- Template files that enable you to set conversion options without modifying at the API level. They can be used to generate a wide range of output, from highly-stylized user-defined HTML to stripped-down, text-only output suitable for use with an indexing engine.
- Sample style sheet: `WordStyle.css` (for word processing documents).

License Information

During installation, the installation program validates the organization name and license key that you enter, and generates the *install/OS/bin/kv.lic* file, where *install* is the directory in which you installed KeyView, and *OS* is the operating system. This file is opened and validated when the KeyView API is used.

The *kv.lic* file contains the organization name and the 31-digit license key you specified during installation. The contents of a *kv.lic* file looks similar to the following:

```
Company Name  
XXXXXXXX-XXXXXXXX-XXXXXXXX-XXXXXXXX
```

The license key controls whether the following are enabled:

- the full version of the KeyView SDK
- the trial version of the KeyView SDK
- language detection and advanced document readers—The following components are considered advanced features, and are licensed separately:
 - Microsoft Outlook Personal Folders (PST) reader (*pstsr* and *pstnsr*)
 - Lotus Notes database (NSF) reader (*nsfsr*)
 - Mailbox (MBX) reader (*mbxsr*)
 - Character set detection library (*kvlangdetect*)

If you change the license key at any time, you must update the licensing information in the *kv.lic* file. See [Update License Information](#).

Enable Advanced Document Readers

To enable advanced readers in one of the KeyView SDKs, you must obtain an appropriate license key from Micro Focus and update the installed license key with the new information as described in [Update License Information](#).

If you are enabling the MBX reader in an existing installation of Export, in addition to updating the license key, change the parameter *208=eml* to *208=mbx* in the *formats_e.ini* file.

Update License Information

If you currently have an evaluation version of KeyView and have purchased a full version of the SDK, or you are adding a document reader (for example, the PST reader), you must update the license information that was installed with the original version of the KeyView SDK.

If you installed a full version of KeyView, but did not enter licensing information at the time of installation, you must also update the license information.

To update the information, do one of the following:

- Manually update the license information that is stored in the text file named *kv.lic*.
- Re-install the product and enter the new license information when prompted.

To update the KeyView license information

1. Open the license key file, `kv.lic`, in a text editor. The file is in the `install\OS\bin` directory, where `install` is the directory in which you installed KeyView, and `OS` is the operating system. The file contains the following text:

```
COMPANY NAME  
XXXXXXX-XXXXXXX-XXXXXXX-XXXXXXX
```

2. Replace the text `COMPANY NAME` with the company name that appears at the top of the License Key Sheet provided by Micro Focus. Enter the text exactly as it appears in the document.
3. Replace the characters `XXXXXX-XXXXXXX-XXXXXXX-XXXXXXX` with the appropriate license key from the License Key Sheet provided by Micro Focus. The license key is listed in the **Key** column in the **Standalone Products** table. The key is a string that contains 31 characters, for example, `2TQD22D-2M6FV66-2KPF23S-2GEM5AB`. Enter the characters exactly as they appear in the document, including the dashes, but do not include a leading or trailing space.
4. The finished `kv.lic` file looks similar to the following:

```
Autonomy  
24QD22D-2M6FV66-2KPF23S-2G8M59B
```

5. Save the `kv.lic` file.

Directory Structure

The following table describes the directories created during the HTML Export installation. The variable `install` is the path name of the Export installation directory (for example, `/usr/autonomy/KeyviewExportSDK` on UNIX, or `C:\Program Files\Autonomy\KeyviewExportSDK` on Windows). On UNIX, the HTML Export directory is named `/htmlxpt`.

The variable `OS` is the operating system for which the SDK is installed. For example, the `bin` directory on a standard 32-bit Windows installation would be located at `C:\Program Files\Autonomy\KeyviewExportSDK\WINDOWS\bin`.

HTML Export installed directory structure

Directory	Description
<code>install\OS\bin</code>	Contains the libraries, executables for sample programs, the Java program (<code>kvraster.class</code>), the Java applet (<code>kvvector.jar</code>), the format detection file, <code>formats_e.ini</code> , the license key file (<code>kv.lic</code>), and a number of other supporting files.
<code>install\OS\lib</code>	(Solaris installations only) Contains the redistributable <code>libstlport.so.1</code> library, which is required to run KeyView on Solaris platforms.
<code>install\dotnet\sample</code>	The <code>HtmlConvFileToFile.cs</code> C# sample program demonstrating the .NET interface.
<code>install\HTML Export\docs</code>	Contains the converted version of the sample word processing, spreadsheet, and presentations files.

HTML Export installed directory structure, continued

Directory	Description
<i>install</i> \HTML Export\guide	Contains the <i>HTML Export C and COM Programming Guide</i> and <i>HTML Export Java Programming Guide</i> in HTML and PDF format.
<i>install</i> \HTML Export\include	Contains the header files.
<i>install</i> \HTML Export\programs\bin	Contains the executable files for the Visual Basic sample program called Export Demo.
<i>install</i> \HTML Export\programs\callback	Contains the C source code and supporting files for a sample program that demonstrates how user callbacks can dynamically shape the HTML conversion.
<i>install</i> \HTML Export\programs\cnv2html	Contains the C source code for a sample program that creates a single HTML file. The executable for this sample program is in the <code>bin</code> directory.
<i>install</i> \HTML Export\programs\ cnv2htmlloop	Contains the C source code for a sample program that creates a single HTML file out of process.
<i>install</i> \HTML Export\programs\comsmp	Contains the Visual Basic source code and supporting files for a sample program that demonstrates the use of the COM interface.
<i>install</i> \HTML Export\programs\ ExportDemo	Contains the source code for a sample Visual Basic program. The executable for this program is in the <code>bin</code> directory. The Export Demo is available through the Start menu.
<i>install</i> \HTML Export\programs\htmlini	Contains the C source code and supporting files for a sample program that uses template files to set the conversion options.
<i>install</i> \HTML Export\programs\htmlloop	Contains a Visual C++ sample program that uses the Microsoft Foundation Classes (MFC) to provide out-of-process HTML conversion using the COM automation server.
<i>install</i> \HTML Export\programs\images	Contains the background graphics and navigation buttons used by the template files.
<i>install</i> \HTML Export\programs\index	Contains the C source code and supporting files for a sample program that produces text-only HTML.
<i>install</i> \HTML Export\programs\ini	Contains the template files used to set the conversion options in the C API.
<i>install</i> \HTML Export\programs\io_samp	Contains the C source code and supporting files for a sample program that demonstrates how to input a stream by providing a simple wrapper around the ANSI C interface <code>fread()</code> , <code>fopen()</code> , and so on.
<i>install</i> \HTML	Contains the C source code and supporting files for a sample

HTML Export installed directory structure, continued

Directory	Description
jstree	program that employs JavaScript to produce an expandable table of contents in a frame-based HTML output file.
<i>install</i> \HTML Export\programs\jvtree	Contains the C source code and supporting files for a sample program that uses the JvTree Java applet in creating an expandable table of contents in a frame-based HTML output file.
<i>install</i> \HTML Export\programs\jvtree_ demo	C code sample that creates a frame-based HTML stream using the JvTree Java applet to display the table of contents.
<i>install</i> \HTML Export\programs\pdfini	Contains the configuration file used to extract custom metadata from PDF documents.
<i>install</i> \HTML Export\programs\tempout	The default output directory for converted files. Contains a sample style sheet.
<i>install</i> \HTML Export\programs\ tstextract	Contains the C source code and supporting files for a sample program that demonstrates the File Extraction interface.
<i>install</i> \HTML Export\programs\wizard	Contains the source code and supporting files for the Visual Basic program HTML Export Template Wizard.
<i>install</i> \HTML Export\rel_ notes	Contains the <i>HTML Export Release Notes</i> in HTML and PDF format.
<i>install</i> \javaapi\ini	Contains the template files used with the Java API.
<i>install</i> \javaapi\javadoc	Contains the Javadoc for the Java API.
<i>install</i> \javaapi\sample	Contains the source files and sample programs for the Java API.
<i>install</i> \testdocs	Contains sample word processing, spreadsheet, and presentation files that you can use to test HTML Export's options. You might also find this directory useful when testing your own applications.

Definition of Terms

The following are specialized terms used throughout the guide.

anchor	HTML markup that defines both anchors and hyperlinks. An anchor is a named place in a document to which other documents can form a link. Anchors use the HTML anchor tags (<a>) to facilitate navigation within a document.
block	All source document content (including subheadings) associated with Heading Level 1. Export identifies and/or generates blocks from the input stream for the implementation of

	the your HTML markup.
block chunk or chunk	All source document content associated with Heading Levels 2 through 6. Chunks are subdivisions of blocks. You can supply specific HTML markup for the different levels of block chunks.
callback	A function optionally supplied by your application and called from the Export API. For example, callbacks allow your application to monitor the progress of the conversion process dynamically.
stream	Transmission of a file's content between memory and disk in a continuous flow.
token	The vehicle for conveying specific types of information to and from the API during the conversion process. Tokens are placeholders for markup that appears in the output. See Export Tokens, on page 359 .

Chapter 2: Getting Started

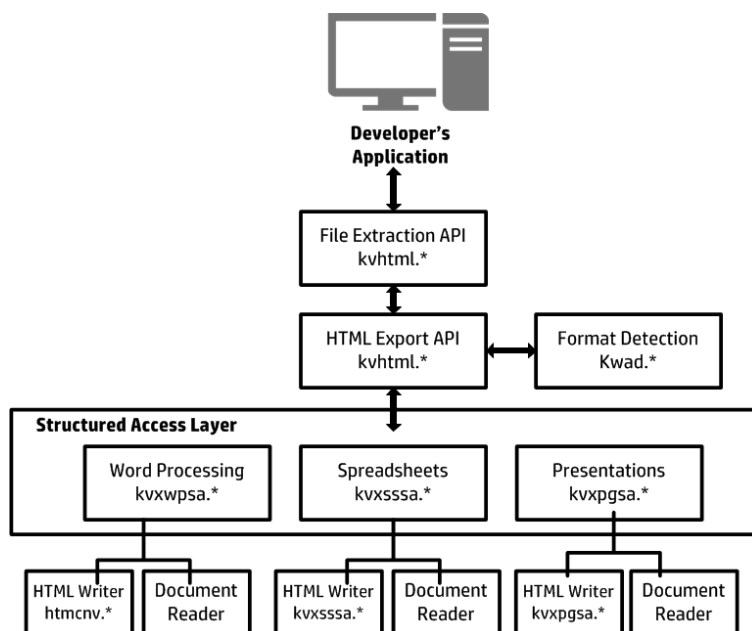

This section provides an overview of the HTML Export SDK and describes how to use the C and COM implementations of the API.

• Architectural Overview	27
• Memory Abstraction	28
• Enhance Performance	29
• Convert Files Out of Process	29
• Convert Files	36
• Subfile Extraction	36
• Set Conversion Options	37
• Use the Export Demo Program	40
• Use the C-Language Implementation of the API	44
• Use the COM Implementation of the API	47

Architectural Overview

The general architecture of the KeyView HTML conversion technology is the same across all supported platforms and is illustrated in [HTML Export Architecture](#), below:

HTML Export Architecture

Each component is described in [Architectural Components](#), on the next page.

Architectural Components

Component	Description
Developer's Application	The developer's application interfaces directly with the HTML Export API through either a C-language, Java, or COM implementation.
File Extraction API	The File Extraction API opens a file and extracts the file's subfiles so that the subfiles are available for conversion. See Use the File Extraction API, on page 51 .
HTML Export API	The HTML Export API exposes the functionality of HTML Export and controls all other HTML Export modules during the conversion process.
Format Detection Module	The format detection module determines the file type of the source file, which enables the HTML Export interface to load the appropriate structured access layer module and document reader. See File Format Detection, on page 362 .
Structured Access Layer	<p>The structured access layer contains three modules: one for word processing, one for spreadsheets, and one for presentations and graphics. Information from the format detection module determines which access layer module operates at this stage of the conversion. The structured access layer performs the following:</p> <ol style="list-style-type: none">1. Loads the appropriate document reader.2. Processes the data stream from the document reader.3. Determines table of contents entries.4. Sends the stream to the appropriate HTML writer.5. Accepts the HTML stream from the HTML writer.6. Generates the HTML output file with a table of contents, metadata, and the document's contents, and sends it to the HTML Export interface.
Document Reader	Each document reader reads a specific file format and sends a text stream of the document to the structured access layer. Word processing readers return a <i>token stream</i> to the structured access layer. A token stream contains the document contents and messages (tokens) that precede the content and identify the type of information that follows them. Each reader is loaded as required by the structured access layer. See Document Readers and Writers, on page 387 for a complete list of document readers.
HTML Writers	Each HTML writer accepts a text stream or token stream from the structured access layer and generates an equivalent HTML stream that is sent back to the structured access layer. The structured access layer then generates the output file. See Document Readers and Writers, on page 387 for a list of format writers.

Memory Abstraction

All dynamic memory allocations in Export modules are abstracted through a C interface. This memory allocation interface is defined in the `KVMemoryStream` structure in `kvtypes.h`. [KVMemoryStream, on page 194](#). You can override all memory allocations by providing a C structure that contains pointers to

functions identical in nature to their standard ANSI C counterpart. The `callback` sample program demonstrates Export memory management features.

[callback](#), on page 120.

Enhance Performance

KeyView is designed for optimal performance out of the box. However, there are some parameters that you can adjust to improve performance specifically for your system.

File Caching

To reduce the frequency of I/O operations, and consequently improve performance, the KeyView readers load file data into memory. The readers then read the data from the cache rather than the physical disk. You can configure the amount of memory used for file caching through the `formats_e.ini` file. Generally, when you increase the memory, performance improves.

By default, KeyView uses a maximum of 1 MB of memory for each thread—assuming a thread contains only one instance of `pContext` that is returned from the session initialization ([fplnit\(\)](#), on page 167). If the file data is larger than 1 MB, up to 1 MB of data is cached and the data beyond 1 MB is read from disk. The minimum amount of memory that can be used for file caching is 64 KB.

To determine a reasonable value, divide the maximum amount of memory you want KeyView to use for file caching by the total number of threads. For example, if you want KeyView to use a maximum of 50 MB of memory and have 10 threads, set the value to 5 MB.

To modify the memory allocated for file caching, change the value for the following parameter in the `[DiskCache]` section of the `formats_e.ini` file:

```
DiskCacheSize=1024
```

The value is in kilobytes. If this parameter is not set or is set to 0 (zero), the minimum value of 64 KB is used.

The `formats_e.ini` file is in the directory `install\OS\bin`, where `install` is the path name of the Export installation directory and `OS` is the name of the operating system.

Convert Files Out of Process

Export can run independently from the calling application. This is called *out of process*. Out-of-process conversions protect the stability of the calling application in the rare case when a malformed document causes Export to fail. You can also run Export in the same process as the calling application. This is called *in process*. However, it is strongly recommended you convert documents out of process whenever possible.

The Export out-of-process framework uses a client-server architecture. The calling application sends an out-of-process conversion request to the Service Request Broker in the main Export process. The Broker then creates, monitors, and manages a Servant process for the request—each request is handled by one independent Servant process. Data is exchanged between the application thread and the Servant through TCP/IP sockets. The source data is sent to the Servant process as a data stream

or file, converted in the Servant, and then returned to the application thread. At that point, the application can either terminate the Servant process or send more data for conversion.

Multiple conversion requests can be sent from multiple threads in the calling application simultaneously. All requests sent from one thread are processed by the Servant mapped to that thread, in other words, each thread can only have one Servant to process its conversion requests.

Any standard conversion errors generated by the Servant are sent to the application.

NOTE: Currently, the main Export process and Servant processes must run on the same host.

The following are requirements for running Export out of process:

- Internet Protocol (TCP/IP) must be installed
- Multithreaded processing must be supported on the operating system platform
- The user application must be built with a multithreaded runtime library

fpConvertStream()	fpGetConvertFileList()
fpGetSummaryInfo()	fpSetStyleMapping()
KVHTMLConfig()	KVHTMLConvertFile()
KVHTMLSetStyleSheet()	

NOTE: When converting in out-of-process mode, these functions must be called after the call to start an out-of-process session and before the call to end an out-of-process session.

Other HTML Export functions, the File Extraction functions, and the COM methods always run in-process.

Configure Out-of-Process Conversions

Although most components of the out-of-process conversion are transparent, the following parameters are configurable:

- File-size threshold/temporary file location
- Conversion time-out
- Listener port numbers and time-out
- Connection time-out and retry
- Servant process name

These parameters are defined internally, but you can override the default by defining the parameter in the `formats_e.ini` file. The `formats_e.ini` file is in the directory `install\OS\bin`, where `install` is the path name of the Export installation directory and `OS` is the name of the operating system.

To set the parameters, add the following section to the `formats_e.ini` file:

```
[KVExportOOPOptions]
TempFileSizeMark=
TempFilePath=
WaitForConvert=
WaitForConnectionTime=
```

```

ListenerPortList=
ListenerTimeout=
ConnectRetryInterval=
ConnectRetry=
ServantName=
EnableDebugOutput=
EnableDebugLog=
LogFilePath=
ClientLogFile=
ServerLogFile=

```

Each parameter is described in [Parameters for Out-of-Process Conversion, below](#). The default values for these parameters are set to ensure reasonable performance on most systems. If you are processing a large number of files, or running Export on a slow machine, you might need to increase some of the time-out and retry values.

Parameters for Out-of-Process Conversion

Parameter	Description
TempFileSizeMark unit = megabytes default=10	The <i>file-size threshold</i> . If the input file received by the Servant is larger than this value, temporary files are created to store the data. The directory in which the temporary files are stored is defined by the TempFilePath parameter. If the file received is smaller than this value, the data is stored in memory in the Servant. This applies only when the input is a stream.
TempFilePath type = file path default = current working directory	The directory in which temporary files are stored. Temporary files are created when you use the fpConvertStream() API, and the input file surpasses the file-size threshold (TempFileSizeMark). If the Servant cannot access the file path, an error is generated. This applies only when converting in stream mode.
WaitForConvert unit = seconds default = 1800 range = 30~3600	The length of time to wait for a Servant to convert a file. If the conversion is not completed within the specified time, the error code "Wait for child process failed" is generated.
WaitForConnectionTime unit = seconds default = 180 range = 15~600	The length of time to wait for the Servant to connect to the application thread after the application has sent a conversion request to the Broker. If the Servant does not connect within the specified time, the error code "Wait for child process failed" is generated. If there are many Servant processes running simultaneously, you might need to increase this value.
ListenerPortList type = integer default = 9985, 9986, 9987, 9988, 9989	The TCP/IP port number used for communication between the calling application and the Servant. You can specify a single port number, or a series of numbers separated by commas.

Parameters for Out-of-Process Conversion, continued

Parameter	Description
<code>ListenerTimeout</code> unit = seconds default = 10 range = 5~30	The length of time to wait for the Servant listener thread to get a process ID from the Servant after the connection is established. If the ID is not obtained within the specified time, the error code "Wait for child process failed" is generated. During this time, no other Servant can connect with the application.
<code>ConnectRetryInterval</code> unit = microseconds default = 0.1 range = 50000~500000	<p>The length of time to wait after a Servant has failed to connect to the application before it retries the connection. A Servant might be unable to connect because the application is waiting for another Servant to send a process ID.</p> <p>To calculate the <i>total retry interval</i>, the value set here is added to the platform-specific TCP retry value (on Windows, this is 1 second).</p>
<code>ConnectRetry</code> type = integer default = 120 range = 30~600	<p>The number of attempts the Servant makes to connect to the calling application. This value and the total retry interval determine the total delay time. The total delay is calculated as follows:</p> $\text{ConnectRetryInterval} + \text{platform-specific_TCP_retry_value} * \text{ConnectRetry}$ <p>For example, if the <code>ConnectRetryInterval</code> is set to 2 seconds, and the Export process is running on Windows (the default TCP retry value on Windows is 1 second), the total delay would be:</p> $2 + 1 * 120 = 360$ <p>The Servant would attempt to connect to the application every 3 seconds for 120 attempts for a total of 360 seconds.</p>
<code>ServantName</code> type = string default = servant	The name of the Servant process. To move the Servant to another location, enter a fully qualified path.

Run Export Out of Process—Overview

To convert files out of process

1. If required, set parameters for the out-of-process conversion in the `formats_e.ini` file. See [Configure Out-of-Process Conversions, on page 30](#).
2. Initialize an Export session.
3. If you are using streams, create an input stream.
4. Define the conversion options.
5. Initialize an out-of-process session.
6. Convert the input and/or call other functions that can run out of process.

7. Shut down the out-of-process session.
8. Repeat Step 3 through Step 7 for additional files.
9. Terminate the out-of-process session and the Servant process.
10. Shutdown the Export session.

Recommendations

- To ensure that multithreaded conversions are thread-safe, you must create a unique context pointer for every thread by calling `fpInit()`. In addition, threads must not share context pointers, and the same context pointer must be used for all API calls in the same thread. Creating a context pointer for every thread does not affect performance because the context pointer uses minimal resources.
- All functions that can run in out-of-process mode must be called within the out-of-process session (that is, after the call to initialize the out-of-process session and before the call to end the out-of-process session).
- When terminating an out-of-process session, persist the Servant process by setting the Boolean flag `bKeepServantAlive` in the `KVHTMLEndOOPSession()` function or `endOOPSession` method. If the Servant process remains active, subsequent conversion requests are processed more quickly because the Servant process is already prepared to receive data. Only terminate the Servant when there are no more out-of-process requests.
- To recover from a failure in the Servant process, start a new out-of-process session. This creates a new Servant process for the next conversion.

Run Export Out of Process

The `cnv2htmlloop` sample program demonstrates how to run Export out of process.

To convert files out of process in the C API

1. If required, set parameters for the out-of-process conversion in the `formats_e.ini` file. See [Configure Out-of-Process Conversions, on page 30](#).
2. Declare instances of the following types and assign values to the members as required:

```
KVHTMLTemplateEx  
KVHTMLOptionsEx  
KVHTMLHeadingInfo  
KVHTMLTOCOptions
```

See [HTML Export API Structures, on page 192](#) for more information.

3. Load the KVHTML library and obtain the `KVHTMLInterfaceEx` entry point by calling `KVHTMLGetInterfaceEx()`.
See [KVHTMLGetInterfaceEx\(\), on page 154](#).
4. Initialize an Export session by calling `fpInit()`. See [fpInit\(\), on page 167](#).
5. If you are using streams for the input and output source, follow these steps; otherwise, proceed to Step 6:
 - a. Create an input stream (`KVInputStream`) by calling `fpFileToInputStreamCreate()`. See [fpFileToInputStreamCreate\(\), on page 158](#).

- b. Create an output stream (KVOutputStream) by calling `fpFileToOutputStreamCreate()`. See [fpFileToOutputStreamCreate\(\)](#), on page 160.
 - c. Proceed to [Set up an out-of-process session by calling KVHTMLStartOOPSession\(\)](#), below.
6. Set up an out-of-process session by calling `KVHTMLStartOOPSession()`.

See [KVHTMLStartOOPSession\(\)](#), on page 183. This function performs the following:

- Initializes the out-of-process session.
- Specifies the input stream or file. If you are using an input file, set `pFileName` to the file name, and set `pInputStream` to `NULL`. If you are using an input stream, set `pInputStream` to point to `KVInputStream`, and set `pFileName` to `NULL`.
- Passes conversion options from the `KVHTMLTemplateEx`, `KVHTMLOptionsEx`, and `KVHTMLTOCOptions` data structures.
- Creates a Servant process.
- Establishes a communication channel between the application thread and the Servant.
- Sends the data to the Servant.

See the sample code in [Example—KVHTMLStartOOPSession](#), below, and [KVHTMLStartOOPSession\(\)](#), on page 183.

7. Convert the input and generate the output files by calling `KVHTMLConvertFile()` or `fpConvertStream()`. The `KVHTMLTemplateEx`, `KVHTMLOptionsEx`, and `KVHTMLTOCOptions` structures are passed in the call to `KVHTMLStartOOPSession()`, and should be `NULL` in the conversion call. A conversion function can be called only once in a single out-of-process session. See [KVHTMLConvertFile\(\)](#), on page 177, and [fpConvertStream\(\)](#), on page 156.
8. Terminate the out-of-process session by calling `KVHTMLEndOOPSession()`. The Servant ends the current conversion session, and releases the source data and session resources. See sample code in [Example—KVHTMLEndOOPSession](#), on the next page, and [KVHTMLEndOOPSession\(\)](#), on page 179.
9. If you used streams, free the memory allocated for the input stream and output stream by calling the `fpFileToInputStreamFree()` and `fpFileToOutputStreamFree()` functions. See [fpFileToInputStreamFree\(\)](#), on page 159 and [fpFileToOutputStreamFree\(\)](#), on page 161.
10. Repeat Step 5 through Step 9 for additional files.
11. After all files are converted, terminate the out-of-process session *and* the Servant process by calling `KVHTMLEndOOPSession()` and setting the Boolean to `FALSE`.
12. After the out-of-process session and Servant are terminated, shut down the Export session by calling `fpShutDown()`. See [fpShutDown\(\)](#), on page 169.

Example—KVHTMLStartOOPSession

The following sample code is from the `cnv2htmlloop` sample program:

```
/* declare OOP startsession function pointer */
KVHTML_START_OOP_SESSION fpKVHTMLStartOOPSession;
/* assign OOP startsession function pointer */
fpKVHTMLStartOOPSession = (KVHTML_START_OOP_SESSION)mpGetProcAddress
                           (hKVHTML, "KVHTMLStartOOPSession");
if(!fpKVHTMLStartOOPSession)
{
```

```
        printf("Error assigning KVHTMLStartOOPSession pointer\n");
        (*KVHTMLInt.fpFileToInputStreamFree)(pKVHTML, &Input);
        (*KVHTMLInt.fpFileToOutputStreamFree)(pKVHTML, &Output);
        mpFreeLibrary(hKVHTML);
        return 7;
    }
/*****START OOP SESSION *****/
if(!(*fpKVHTMLStartOOPSession)(pKVHTML,
    &Input,
    NULL,
    &HTMLTemplates,      /* Markup and related variables */
    &HTMLOptions,         /* Options */
    NULL,                 /* TOC options */
    &oopServantPID,
    &error,
    0,
    NULL,
    NULL))
{
    printf("Error calling fpKVHTMLStartOOPSession \n");
    (*KVHTMLInt.fpShutDown)(pKVHTML);
    mpFreeLibrary(hKVHTML);
    return 9;
}
```

Example—KVHTMLEndOOPSession

The following sample code is from the `cnv2htmlloop` sample program:

```
/* declare endsession function pointer */
KVHTML_END_OOP_SESSION    fpKVHTMLEndOOPSession;
/* assign OOP endsession function pointer */
fpKVHTMLEndOOPSession = (KVHTML_END_OOP_SESSION)mpGetProcAddress
    (hKVHTML, "KVHTMLEndOOPSession");
if(!fpKVHTMLEndOOPSession)
{
    printf("Error assigning KVHTMLEndOOPSession pointer\n");
    (*KVHTMLInt.fpFileToInputStreamFree)(pKVHTML, &Input);
    (*KVHTMLInt.fpFileToOutputStreamFree)(pKVHTML, &Output);
    mpFreeLibrary(hKVHTML);
    return 8;
}
/*****END OOP SESSION, DO NOT KEEP SERVANT ALIVE *****/
if(!(*fpKVHTMLEndOOPSession)(pKVHTML,
    FALSE,
    &error,
    0,
    NULL,
    NULL))
```

```
{  
    printf("Error calling fpKVHTMLEndOOPSession \n");  
    (*KVHTMLInt.fpShutDown)(pKVHTML);  
    mpFreeLibrary(hKVHTML);  
    return 10;  
}
```

Convert Files

KeyView Export SDK enables you to *convert* many different types of documents to HTML. Converting is the process of extracting the text from a document without the application-specific markup, and applying HTML markup. However, the conversion process can also include the following:

- Extracting subfiles—exposes all subfiles for conversion. See [Subfile Extraction, below](#).
- Setting conversion options—determines the content, structure, and appearance of the HTML output. See [Set Conversion Options, on the next page](#).
- Extracting the file's format—detects a file's format, and reports the information to the API, which in turn reports the information to the developer's application. See [Extract File Format Information, on page 76](#).
- Extracting metadata—extracts selected metadata (document properties) from a file. See [Extract Metadata, on page 73](#).
- Converting character sets—controls the character set of both the input and the output text. See [Convert Character Sets, on page 76](#).
- Implementing callbacks—controls the conversion while it is in progress. See [HTML Export API Callback Functions, on page 187](#).

You can use one of the following methods to convert documents:

- Use the Export Demo sample program. This Visual Basic program demonstrates most Export API functionality and is the easiest way to get started. See [Use the Export Demo Program, on page 40](#).
- Use the C-language implementation of the API from your C or C++ application. See [Use the C-Language Implementation of the API, on page 44](#).
- Use the COM implementation of the API from your Visual Basic, Delphi, or J++ or C application (32-bit Windows platforms only). See [Use the COM Implementation of the API, on page 47](#).
- Use the C or COM sample programs. See [Sample Programs, on page 112](#).

NOTE: Micro Focus strongly recommends that you convert documents *out of process*. During out-of-process conversion, Export runs independently from the calling application. Out-of-process conversions protects the stability of the calling application in the rare case when a malformed document causes Export to fail. [Convert Files Out of Process, on page 29](#).

Subfile Extraction

To convert a file, you must first determine whether the source file contains any subfiles (attachments, embedded objects, and so on). A file that contains subfiles is called a *container* file. Compressed files

(such as Zip), mail messages with attachments (such as Microsoft Outlook Express), mail stores (such as Microsoft Outlook Personal Folders), and compound documents with embedded OLE objects (such as a Microsoft Word document with an embedded Excel chart) are examples of container files.

If the file is a container file, the container must be opened and its subfiles extracted by using the *File Extraction API*. The extraction process is done repeatedly until all subfiles are extracted and exposed for conversion. After a subfile is extracted, you can use the HTML Export API to convert the file.

If a file is not a container, you should pass it directly to the HTML Export API for conversion without extraction.

See [Use the File Extraction API, on page 51](#) for more information.

Convert Outlook Email without Using the Extraction API

Micro Focus strongly recommends that you convert all container files, including Microsoft Outlook files, by using the File Extraction API. However, you can convert Outlook email messages (MSG) directly by using the Export API and the MSG reader (msgsr).

NOTE: The MSG reader only extracts the message body of an MSG file. Attachments are not extracted.

To convert MSG files by using the MSG reader, add the following to the `formats_e.ini` file (TRUE is case-sensitive):

```
[ContainerOptions]
bConvertMSG=TRUE
```

Set Conversion Options

Conversion options are parameters that determine the content, structure, and appearance of the HTML output. For example, you can specify the markup inserted at the beginning and end of specific HTML blocks, whether a heading is included in the table of contents, the output character set, or the resolution at which graphics are converted. The conversion options can be set either in the API or in the template files. Regardless of the method used to set the options, the values are ultimately passed to the API and used to populate the following data structures:

- [KVHTMLTemplateEx, on page 217](#)
- [KVHTMLOptionsEx, on page 208](#)
- [KVHTMLHeadingInfo, on page 201](#)
- [KVHTMLTOCOptions, on page 222](#)

The conversion options are described in [HTML Export API Structures, on page 192](#).

Set Conversion Options by Using the API

Set conversion options by using any of the following functions:

- [fpConvertStream\(\), on page 156](#)
- [KVHTMLConvertFile\(\), on page 177](#)

- [KVHTMLStartOOPSession\(\)](#), on page 183

Set Conversion Options by Using the Template Files

HTML Export includes templates in the form of initialization files (.ini). The templates provide a quick and easy way to modify the conversion options without programming at the API level. However, the template files do not give you complete control of the conversion process. To control some features, you must use the API directly.

You can use a text editor to customize the template files. For example, to change the output character set from the default KVCS_UNKNOWN to KVCS_SJIS in the default.ini template, make the following change shown in bold:

```
[KVHTMLOptionsEx]
OutputCharSet=KVCS_SJIS
bUseDocumentColors=TRUE
```

To create valid HTML, a template file *must* define at least two structures: KVHTMLTemplateEx and KVHTMLOptionsEx.

NOTE: If you enter markup in the template files that is not compliant with HTML standards, HTML Export inserts the markup into the output file unchanged. This might result in a malformed HTML file.

An application must then read the template file and write the data to the appropriate Export structures. In the sample program `htmlini`, a template file is supplied as a command-line argument (see [htmlini](#), on page 118).

The characteristics of some of the template files are demonstrated in the HTML Export Getting Started page. The Getting Started page, named `htmstart.html`, is in the directory `install\htmlexport\docs`, where `install` is the path name of the Export installation directory. It compares the output generated using a set of sample documents and the template files. The source documents used in the page are in the directory `install\testdocs`.

Templates

The template files for the C API implementation are in the directory `install\htmlexport\programs\ini`, where `install` is the path name of the Export installation directory. The following templates are provided:

Template	Description
Arabic (bidi_arabic.ini)	<ul style="list-style-type: none">• Based on the default template (default.ini).• The Arabic character set is defined in the template.• <code><dir="rtl"></code> added to the Body tag to indicate that the text is read from right to left.
Cascading style sheet (css_ex.ini)	This template writes style sheet information to an external Cascading Style Sheet (CSS) file or reads the information from an existing CSS file. This makes the HTML output significantly smaller because the information is not stored

Template	Description
	<p>within the output file. It also allows you to use the same style sheet for many conversions.</p> <p>See Use Style Sheets, on page 84 and Use Style Sheets with htmli, on page 120 for more information on using an external CSS file.</p>
Default (default.ini)	<ul style="list-style-type: none"> Segments word processing documents, spreadsheets, and presentations into multiple files according to the document's heading levels. Creates two frames. The table of contents (based on the source document's heading levels and page breaks) appears in the left frame. The document contents associated with the table of contents entry selected in the left frame appears in the right frame. Inserts Previous and Next buttons at the end of each block. Supports URLs. Supports headers, footers, footnotes, and endnotes. Converts graphics to JPEG with the original size preserved. Converts presentation slides to HTML as individual JPEG files.
Hebrew (bidi_Hebrew.ini)	<ul style="list-style-type: none"> Based on the default template (default.ini). The Hebrew character set is defined in the template. <dir="rtl"> added to the Body tag to indicate that text is read from right to left.
Low bandwidth (lowband.ini)	<p>This template is useful when you need to provide information to a mobile workforce that might not always have access to fast connections.</p> <ul style="list-style-type: none"> Creates text-only HTML. Suppresses the source document's embedded graphics.
Multiple files with three frames (logotoc.ini)	<ul style="list-style-type: none"> Segments word processing documents, spreadsheets, and presentations into multiple files according to the document's heading levels. Creates three frames. A corporate logo is displayed in the top left frame. The table of contents (based on source document heading levels and page breaks) appears in the bottom left frame, and the HTML files appear in the right frame. Inserts Previous and Next links at the end of each block. Supports URLs.
No frills (nofrills.ini)	<ul style="list-style-type: none"> Creates a single HTML file. Supports URLs. Maintains the source document's fonts and styles. Does not create a table of contents. Does not list the source document's metadata.
PDF bookmarks in a frame	<p>This template is optimized to display PDF bookmarks in a separate frame.</p> <ul style="list-style-type: none"> Segments a PDF file into two HTML files; one contains the table of contents

Template	Description
pdfframe.ini)	<p>(based on the bookmarks in the PDF file), and the other contains the document text.</p> <ul style="list-style-type: none">• Creates two frames. The table of contents appears in the left frame, and the document appears in the right frame.• Forces the output character set to UTF-8.• Does not insert Back to Top, Previous, or Next links. <p>See Convert PDF Files, on page 89 for more information on generating a table of contents from bookmarks in a PDF file.</p>
Single file with table of contents (onefiletoc.ini)	<p>This template is useful when you want to print the document.</p> <ul style="list-style-type: none">• Creates a single HTML file.• Creates a table of contents at the top of the HTML document.• Uses worksheet names to create the table of contents entries for spreadsheets. If worksheet names do not exist in the source document, "Sheet1," "Sheet2," "Sheet3," and so on are used.• Uses slide titles to create the table of contents entries for presentations. If slide titles do not exist in the source document, "slide 1," "slide 2," "slide 3," and so on are used.• Lists all metadata (Title, Subject, Author, Comments, and so on).• Converts graphics to JPEG with the original resolution preserved.• Converts presentation slides to HTML as individual JPEG files.
Style mapping (wordstyle.ini)	<p>This template demonstrates how to map paragraph and character styles in a word processing document to arbitrary markup (including CSS, XML, or HTML). Using style mapping, you can use external Cascading Style Sheet (CSS) files to define styles used in the HTML, alter the structure of a document, delete content, or replace content with a specified character (redact).</p> <p>See Map Styles, on page 81.</p>
UNIX web server (defunix.ini)	<ul style="list-style-type: none">• Based on the default template (default.ini).• Converts embedded graphics or presentations to either JPEG or HTML Export's Java target. See Display Vector Graphics on UNIX and Linux, on page 84.

Use the Export Demo Program

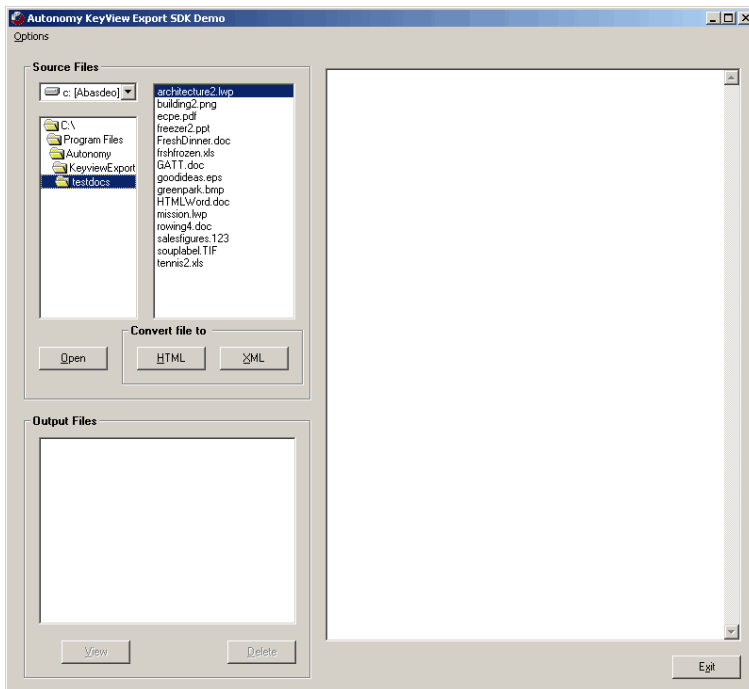

The easiest way to get started with Export is to become familiar with its capabilities through the Visual Basic sample program, Export Demo. The source code for the program is in the directory `install\htmlexport\programs\ExportDemo`, where `install` is the path name of the Export installation directory. Export Demo is for Windows only, and requires Internet Explorer 4.01 with Service Pack 1 or higher.

The output options that control the look of the output files are predefined in Export Demo and cannot be changed in the user interface. Export Demo uses a small sample of the options available in the Export API.

The Template Wizard sample program is an example of a Visual Basic program that does allow the user to control some of the output options with template files. See [Template Wizard, on page 122](#). You can use the sample documents in the directory *install\testdocs* to experiment with converting different file formats.

To launch the sample program, select **Export Demo** from **Start | Programs | Autonomy | Export SDK | HTML Export**. The following dialog appears:

Export Demo: Launching

NOTE: XML conversion using XML Export is available in Export Demo if you have XML Export installed. If you do not have XML Export installed, the **XML** button is disabled.

Change Input/Output Directories

If HTML Export is installed in the default directory, the output and input directories are automatically set.

The default location for source files is the directory *install\testdocs*.

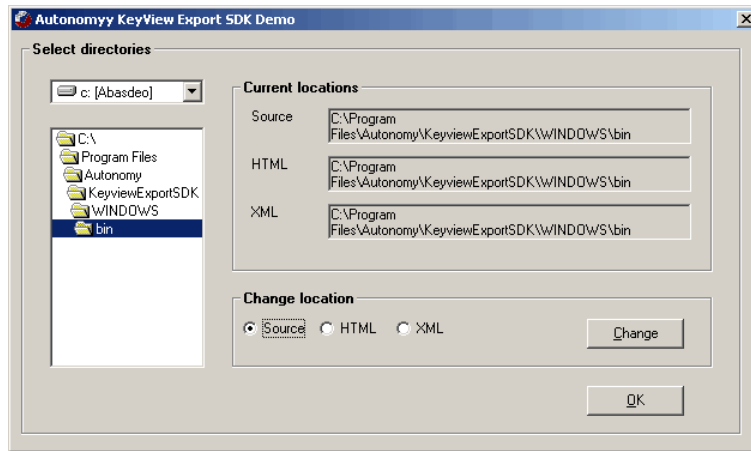

The default location for output files is the directory *install\htmlexport\programs\tempout*.

If HTML Export is installed in a directory other than the default, you are prompted to select an output and input directory when you first start Export Demo.

To change the default directories for the source and output files

1. Select **Options | Set Directories**. The following dialog appears:

Export Demo: Setting Directories

2. From the tree view, select the drive letter and directory for the source or output files.
3. In **Change Location**, select which files are stored in the directory, either **Source** or **HTML**.
4. Click **Change**. The **Current Locations** fields are updated with the new selection.
5. Follow the same procedure for the other file types.

Set Configuration Options

With HTML Export, you can configure options prior to the document conversion by using the `KVHTMLConfig()` function. Export Demo demonstrates this function, and allows you to:

- Specify a PDF reader.
- Specify whether rotated text in a PDF file is displayed in its original position or at the bottom of the page.

Convert PDF Files

In Export Demo, PDF documents can be converted in one of two ways:

- generate HTML output by using the basic PDF reader (`pdfsr`)
- generate a raster image for each page of the PDF file by using a graphic-based PDF reader (`kppdfdrdr` or `kppdf2rdr`). See [Convert PDF Files to Raster Images, on page 92](#).

Export Demo provides an option to select the type of reader you want to use to convert PDF documents. By default, the basic reader (`pdfsr`) is used to convert PDF documents.

To specify that the graphic-based reader be used to convert PDF documents

1. Ensure that Export Demo is not running.
2. Set the appropriate configuration file options. See [Convert PDF Files, on page 89](#).
3. Start the Export Demo program.

4. Select **Options | HTML Config | Set Hifi**.

NOTE: Note: PDF documents can also be converted to a logical reading order by using the PDF reader `pdfsr`. This feature is demonstrated in the sample program `cnv2html`. See [Convert PDF Files to a Logical Reading Order, on page 92](#).

Convert Rotated Text

In HTML Export, you can specify how rotated text is displayed in the HTML output. By default, rotated text in a file is displayed in its original position, at the original font size, and at 0 degrees rotation. Because the text is the original size, but might be displayed in a smaller space, the text might overlap adjacent text in the HTML output. You use the text rotation configuration option to avoid this problem. If this option is set, rotated text is displayed at the bottom of the page on which it appears. See [Convert Rotated Text, on page 97](#). Currently, this configuration option applies only to PDF files.

To specify that rotated text be displayed at the bottom of the page on which it appears, select **Options | HTML Config | Set Text Rotate**.

Convert Files

To convert a single file

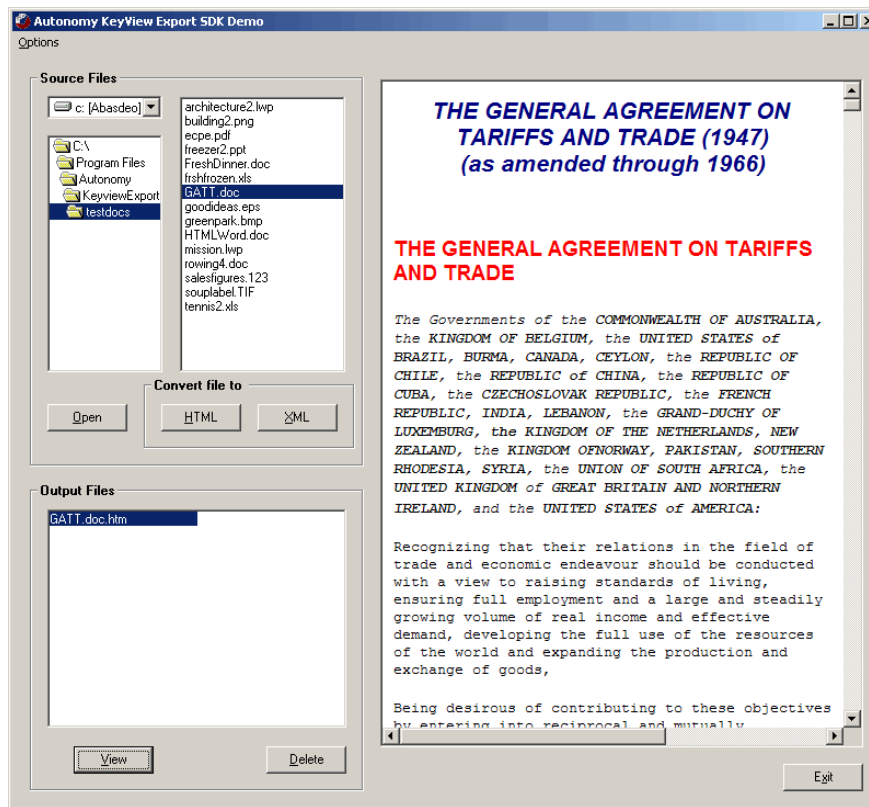

1. Select **Options | Convert | Single file**.
2. Select the document from the file list, and then click **HTML** in the **Convert file to** pane.

To convert files in a directory

1. Select **Options | Convert | Entire directory**.
2. Click **HTML** in the **Convert directory to** pane.

To view a converted file, double-click the output file in the **Output Files** pane, or select the output file, and then click **View**. The converted file is displayed in the view pane:

Export Demo: Converting Files

To view the original document, select the document from the file list, and then click **Open**. If you have an application on your system associated with the file, the file is displayed in that application.

To delete output files, select the file in the **Output Files** pane and click **Delete**.

Use the C-Language Implementation of the API

The C-language implementation of the API is divided into the following function suites:

- [File Extraction API Functions, on page 129](#)—Open and extract subfiles in a container file. These functions also extract metadata and file format information, and control character set conversion on extraction.
- [HTML Export API Functions, on page 154](#)—Extract format information (metadata, character set, and format), create an input/output stream from a file, and open, convert, and close the stream.
- [HTML Export API Callback Functions, on page 187](#)—Controls the conversion while it is in progress.

Input/Output Operations

In the Export API, the source input and target output can be either a physical file accessed through a file path, or a *stream* created from a data source. A stream is a C structure that contains pointers to I/O functions similar in nature to their standard ANSI C counterparts. This structure is passed to Export functions in place of the standard input source. The input stream is defined by the structure

KVInputStream in kvtypes.h. The output stream is defined by the structure KVOutputStream in kvtypes.h. See [KVInputStream](#), on page 193 and [KVOutputStream](#), on page 194.

You can create an input stream either by using the `fpFileToInputStreamCreate()` function, or by using code similar to the example code in the `io_samp` sample program. You can create an output stream by using the `fpFileToOutputStreamCreate()` function. These functions assign C equivalent I/O functions to `fpOpen()`, `fpRead()`, `fpSeek()`, `fpTell()`, and `fpClose()`. See [fpFileToInputStreamCreate\(\)](#), on page 158 and [fpFileToOutputStreamCreate\(\)](#), on page 160.

Convert Files

To use the C-language implementation of the API

1. Develop the HTML markup and tokens to be assigned to the required members of a declared instance of KVHTMLTemplateEx.

If you use markup in the structure that is not compliant with HTML standards, HTML Export inserts the markup into the output file unchanged. This might result in a malformed HTML file.

2. Declare instances of the following types and assign values to the members as required:

```
KVHTMLTemplateEx  
KVHTMLOptionsEx  
KVHTMLHeadingInfo  
KVHTMLTOCOptions
```

See [HTML Export API Structures](#), on page 192 for more information.

3. Load the KVHTML library and obtain the KVHTMLInterfaceEx entry point by calling `KVHTMLGetInterfaceEx()`. See [KVHTMLGetInterfaceEx\(\)](#), on page 154.
4. Initialize an Export session by calling `fpInit()`. The function's return value, `pContext`, is passed as the first argument to all other Export functions. See [fpInit\(\)](#), on page 167.
5. Pass the context pointer from `fpInit()` and the address of a structure containing pointers to the File Extraction API functions in the call to `KVGetExtractInterface()`. See [KVGetExtractInterface\(\)](#), on page 129.
6. If you are using streams for the input and output source, follow these steps; otherwise, proceed to Step 7:
 - a. Create an input stream (KVInputStream) either by calling `fpFileToInputStreamCreate()`, or by using code similar to the example code in the `io_samp` sample program. [fpFileToInputStreamCreate\(\)](#), on page 158.
 - b. Create an output stream (KVOutputStream) either by calling `fpFileToOutputStreamCreate()`, or by using code similar to the example code in the `io_samp` sample program. [fpFileToOutputStreamCreate\(\)](#), on page 160.
 - c. Proceed to Step 7.
7. Declare the input stream or file name in the KVOpenFileArg structure. See [KVOpenFileArg](#), on page 147.
8. Open the source file by calling `fpOpenFile()` and passing the KVOpenFileArg structure. This call defines the parameters necessary to open a file for extraction. See [fpOpenFile\(\)](#), on page 137.
9. Determine whether the source file is a container file (contains subfiles) by calling `fpGetMainFileInfo()`. See [fpGetMainFileInfo\(\)](#), on page 133.

10. If the call to `fpGetMainFileInfo()` determined the source file is a container file, proceed to Step 11; otherwise, proceed to Step 14.
11. Determine whether the subfile is itself a container (contains subfiles) by calling `fpGetSubFileInfo()`. See [fpGetSubFileInfo\(\)](#), on page 134.
12. Extract the subfile by calling `fpExtractSubFile()`. See [fpExtractSubFile\(\)](#), on page 130.
13. If the call to `fpGetSubFileInfo()` determined the subfile is a container file, repeat Step 6 through Step 12 until all subfiles are extracted; otherwise, proceed to Step 14.
14. Setup an out-of-process session by calling `KVHTMLStartOOPSession()`. See [KVHTMLStartOOPSession\(\)](#), on page 183.
15. Convert the input and generate the output files by calling `KVHTMLConvertFile()` or `fpConvertStream()`. The structures `KVHTMLTemplate`, `KVHTMLOptions`, and `KVHTMLTOCOptions` are defined in the call to `KVHTMLStartOOPSession()`, and should be `NULL` in the conversion call. A conversion function can be called only once in a single out-of-process session. See [KVHTMLConvertFile\(\)](#), on page 177, and [fpConvertStream\(\)](#), on page 156.
16. If you are using callbacks, they are called while the conversion process is underway. If required, you can specify alternate paths and file names for output files, including using the table of content entries for the file names. See [HTML Export API Callback Functions](#), on page 187.
17. If you are converting additional files, terminate the out-of-process session by calling `KVHTMLEndOOPSession()` and setting the Boolean to `TRUE`. The Servant ends the current conversion session, and releases the source data and session resources.

If you are not converting additional files, terminate the out-of-process session *and* the Servant process by calling `KVHTMLEndOOPSession()` and setting the Boolean to `FALSE`. See [KVHTMLEndOOPSession\(\)](#), on page 179.
18. Close the file by calling `fpCloseFile()`. See [fpCloseFile\(\)](#), on page 130.
19. If you used streams, free the memory allocated for the input stream and output stream by calling the functions `fpFileToInputStreamFree()` and `fpFileToOutputStreamFree()`. See [fpFileToInputStreamFree\(\)](#), on page 159 and [fpFileToOutputStreamFree\(\)](#), on page 161.
20. Repeat Step 6 through Step 18 for additional source files.
21. Shutdown the Export session by calling `fpShutDown()`. See [fpShutDown\(\)](#), on page 169.

Multithreaded Conversions

To ensure that multithreaded conversions are thread-safe, you must create a unique context pointer for every thread by initializing the Export session with `fpInit()`. In addition, threads must not share context pointers, and the same context pointer must be used for all API calls in the same thread. Creating a context pointer for every thread does not affect performance because the context pointer uses minimal resources.

For example, your code should have the following logic for one thread:

```
fpInit()  
    KVGetExtractInterface()  
    fpFileToInputStreamCreate()  
    fpFileToOutputStreamCreate()  
        fpOpenFile()  
        fpGetMainFileInfo()          /* container file */
```

```
    fpGetSubFileInfo()
    fpExtractSubFile
    KVHTMLStartOOPSession()
    fpConvertStream()
    KVHTMLEndOOPSession(bKeepServantAlive TRUE)
    fpCloseFile()
fpFileToInputSreamFree()
fpFileToOutputStreamFree()
    set input/output file
    fpOpenFile()
    fpGetMainFileInfo()          /* not a container file */
    KVHTMLStartOOPSession()
    KVHTMLConvertFile()
    KVHTMLEndOOPSession(bKeepServantAlive TRUE)
    fpCloseFile()
...
fpShutdown()
```

Use the COM Implementation of the API

The COM implementation of HTML Export is only applicable to Win32 environments. It is supported in both out-of-process (*htmsserv.exe*) and in-process (*htmsserv.dll*) versions. Programming with either interface is identical. The out-of-process version provides a more robust HTML conversion, but at the expense of making out-of-process calls. To use either version of the COM implementation, you must register the COM component. Both components support self-registration and self-unregistration. You can only register one COM component.

To use the COM Automation Server

1. Register the COM server by using one of the following methods:

- To register the out-of-process COM server, run:

```
install\OS\bin\htmsserv.exe -RegServer
```

- To register the in-process COM server, run:

```
regsvr32.exe install\OS\bin\htmsserv.dll
```

- To unregister the out-of-process COM server, run:

```
install\OS\bin\htmsserv.exe -UnRegServer
```

and then reboot the machine.

- To unregister the in-process COM server, run:

```
regsvr32.exe -u install\OS\bin\htmsserv.dll
```

where *install* is the path name of the Export installation directory.

The *regsvr32.exe* is a Microsoft Windows program used to register in-process COM objects and is stored in the *install\OS\bin* directory.

2. Confirm the following entry is in the Windows registry:

```
\\HKEY_CLASS_ROOT\\VerityHtmServ.Application
```

3. Create an instance of the COM object. See the `comsamp` sample for an example.
4. Specify the source file by using the `pszInputFile` property.
5. Specify the location of the HTML Export libraries by using the `pszKeyViewDir` property.
6. Use the properties and methods described in [COM Interface Methods and Events, on page 247](#) and [COM Interface Properties, on page 252](#).

Sample Implementation

The following code, which is found in the sample Visual Basic program named `comsamp`, demonstrates how to use the properties, methods, and events of the ActiveX Controls from within Visual Basic.

Define the `htmserv` Object

The sample code will not function unless you first define the `htmserv` object in Visual Basic.

To define the object for Visual Basic 6

1. Select **References...** from the **Project** menu.
2. Search available references for "HTML Export COM Server Library," and select it.
3. If the HTML Export COM Server Library is unavailable, follow the registering instructions in [Use the COM Implementation of the API, on the previous page](#).

Sample Code

1. Declare the variable `MyRef` as an instance of `htmserv` (the HTML Export COM server):

```
Dim WithEvents MyRef As htmserv
```

2. Specify the source file by setting the input file property `pszInputFile`:

```
Private Sub Convert_Click()  
MyRef.pszInputFile = File1.Path & "\" & File1.FileName
```

3. Define the `GetSummaryInfo` method and metadata properties:

```
Dim nTotal As Long  
Dim nValid As Long  
Dim nType As Long  
Dim nVal As Long  
Dim szVal As String  
Dim szUserVal As String  
...  
On Error GoTo Handler  
Call MyRef.GetSummaryInfo(3, nTotal, nValid, nType, nVal, szVal, szUserVal)  
MsgBox szUserVal & " = " & szVal
```

4. Call the `ConvertFileToFile` method:

Convert:

```
nRet = MyRef.ConvertFileToFile("c:\temp\temp.htm")
WebBrowser1.Navigate ("c:\temp\temp.htm")
Exit Sub
```

5. The `comsamp` sample program specifies the default directory for source files as the `C:\Program Files\Autonomy\KeyviewExportSDK\testdocs` directory, and the directory in which binaries are stored as the `C:\Program Files\Autonomy\KeyviewExportSDK\>OS\bin` directory, where `OS` is the name of the operating system. To change these directories to match your installation, set the `Path` property to the location of the `testdocs` directory, and set the `pszKeyViewDir` property to the location of the HTML Export binary files:

```
Private Sub Form_Load()
    Set MyRef = New htmserv
    Dir1.Path = "C:\myinstall\testdocs"
    MyRef.pszKeyViewDir = "C:\myinstall\bin"
End Sub
```

6. Implement the `Continue` event that is called by HTML Export:

```
Private Function MyRef_Continue(ByVal PercentDone As Long) As Long
    ProgressBar1.Value = PercentDone
    MyRef_Continue = True
    ProgressBar1.Refresh
End Function
```

See [Continue, on page 251](#) for more information.

7. Implement the `UserCallback` event:

```
Private Function MyRef_UserCallback(ByVal szUserString As String) As String
    MsgBox (szUserString)
    MyRef_UserCallback = "Output this text to HTML"
End Function
```

See [UserCallback, on page 251](#) for more information.

The code below demonstrates an alternate way to initiate an instance of the COM server:

```
Dim HTM As Object
Set HTM = CreateObject("VerityHtmServ.Application")
```

where `HTM` is the COM Automation Server object.

Part II: Use the Export API

This explains how to perform some basic tasks by using the File Extraction and Export APIs, and describes the sample programs. It contains the following chapters:

- [Use the File Extraction API, on page 51](#)
- [Use the HTML Export API, on page 73](#)
- [Sample Programs, on page 112](#)

Chapter 3: Use the File Extraction API

This section describes how to extract subfiles from a container file by using the File Extraction API.

• Introduction	51
• Extract Subfiles	52
• Extract Images	53
• Recreate a File's Hierarchy	53
• Extract Mail Metadata	54
• Extract Subfiles from Outlook Files	61
• Extract Subfiles from Outlook Express Files	61
• Extract Subfiles from Mailbox Files	62
• Extract Subfiles from Outlook Personal Folders Files	62
• Extract Subfiles from Lotus Domino XML Language Files	65
• Extract Subfiles from Lotus Notes Database Files	66
• Extract Subfiles from PDF Files	69
• Extract Embedded OLE Objects	70
• Extract Subfiles from ZIP Files	70
• Default File Names for Extracted Subfiles	70

Introduction

To convert a file, you must first determine whether the file contains any subfiles (attachments, embedded OLE objects, and so on). A file that contains subfiles is called a *container* file. A container file has a main file (parent) and subfiles (children) embedded in the main file.

The following are examples of container files:

- Archive files such as ZIP, TAR, and RAR.
- Mail messages such as Outlook (MSG) and Outlook Express (EML).
- Mail stores such as Microsoft Outlook Personal Folders (PST), Mailbox (MBX), and Lotus Notes database (NSF).
- PDF files that contain file attachments.
- Compound documents with embedded OLE objects such as a Microsoft Word document with an embedded Excel chart.

NOTE: [Supported Formats](#), on page 276 indicates which formats are treated as container files and are supported by the File Extraction API.

The subfiles might also be container files, creating a file hierarchy of multiple levels. For example, an MSG file (the root parent) might contain three attachments:

- a Microsoft Word document that contains an embedded Microsoft Excel spreadsheet.
- an AutoCAD drawing file (DWG).
- an EML file with an attached Zip file, which in turn contains four archived files.

NOTE: The parent MSG file contains four first-level children. The body text of a message file, although not a standalone file in the container, is considered a child of the parent file.

Extract Subfiles

To convert all files in a container file, you must open the container and extract its subfiles by using the *File Extraction API*. The extraction process is done repeatedly until all subfiles are extracted and exposed for conversion. After a subfile is extracted, you can call Export API functions to convert the file.

If you want to convert a container file and its subfiles to a single file, you must extract all files from the container, convert the files, and then append each converted output file to its parent.

To extract subfiles

1. Pass the context pointer from `fpInit()` and the address of a structure that contains pointers to the File Extraction API functions in the call to `KVGetExtractInterface()`.
2. Declare the input stream or file name in the `KVOpenFileArg` structure.
3. Open the source file by calling `fpOpenFile()` and passing the `KVOpenFileArg` structure. This call defines the parameters necessary to open a file for extraction.
4. Determine whether the source file is a container file (that is, whether it contains subfiles) by calling `fpGetMainFileInfo()`.
5. If the call to `fpGetMainFileInfo()` determined that the source file is a container file, proceed to

- step 6; otherwise, convert the file.
6. Determine whether the subfile is itself a container (that is, whether it contains subfiles) by calling `fpGetSubFileInfo()`.
 7. Extract the subfile by calling `fpExtractSubFile()`.
 8. If the call to `fpGetSubFileInfo()` determined that the subfile is a container file, repeat step 2 through step 7 until all subfiles are extracted and the lowest level of subfiles is reached; otherwise, convert the file.

Extract Images

You can use the File Extraction API to extract images within the file by specifying the following in the `formats.ini` file:

```
[Options]
ExtractImages=TRUE
```

If you set this option, images within the file behave in the same way as any other subfile. Extracted images have the name `image[X].[Y]`, where `[X]` is an integer, and `[Y]` is the extension. The format of the image is the same as the format in which it is stored in the document.

This option can also be enabled by passing `KVFLT_EXTRACTIMAGES` to the `fpFilterConfig` function.

Recreate a File's Hierarchy

When you extract a container file, any relationships between the subfiles in the container are not maintained. However, the File Extraction interface provides information that enables you to recreate the hierarchy. You can use the hierarchy to create a directory structure in a file system, or to categorize documents according to their relationship to each other. For example, if you use `KeyView` to generate text for a search engine, the hierarchical information enables your users to search for a document based on the document's parent or sibling. In addition, when the document is returned to the user, the parent and sibling documents can be returned as recommendations.

The information needed to recreate a file's hierarchy is provided in the call to `fpGetSubFileInfo()`. The members `KVSubFileInfo->parentIndex` and `KVSubFileInfo->childArray` provide information about a subfile's parent and children. Because you can only retrieve the first-level children in the subfile, you must call `fpGetSubFileInfo()` repeatedly until information for the leaf-node children is extracted.

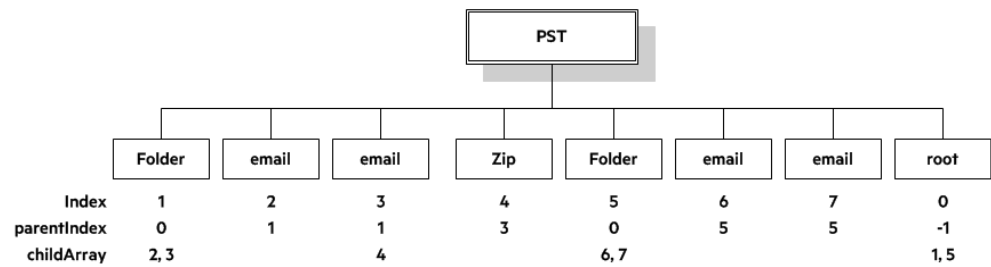

Create a Root Node

Because of their structure, some container files do not contain a subfile or folder which acts as a root directory on which the hierarchy can be based. For example, subfiles in a Zip archive can be extracted, but none of the subfiles represent the root of the hierarchy. In this case, you must create an artificial *root node* at the top of the file hierarchy as a point of reference for each child, and ultimately to recreate the relationships. This artificial root node is an internal object, and is extracted to disk as a directory called `root`. Its index number is 0.

To create the root node, set `openFlag` to `KVOpenFileFlag_CreateRootNode` in the call to `fpOpenFile()`. When you create a root node, the value of `numSubFiles` in `KVMainFileInfo` includes the root node. For example, when you call `fpGetMainFileInfo()` on a Microsoft Word document with three embedded OLE objects and the root node is disabled, `numSubFiles` is 3. If you create a root node, `numSubFiles` is 4.

Recreate a File’s Hierarchy—Example

For example, you might extract a PST file that contains seven subfiles with a root node enabled. The call to `fpGetMainFileInfo()` returns the number of subfiles as eight (seven subfiles and one root node). The following diagram shows the structure and the available hierarchy information after the subfiles are extracted:

The `parentIndex` specifies the index number of a subfile’s parent. The `childArray` specifies an array of a subfile’s children. With this information, you can recreate the hierarchy shown in the following diagram.

Extract Mail Metadata

You can extract metadata, such as subject, sender, and recipient, from MSG, EML, MBX, PST, and NSF files, by calling the `fpGetSubFileMetaData()` function. You can extract a predefined set of metadata fields, individual fields, or both, that are unique to a file format.

Default Metadata Set

KeyView internally defines a set of common mail metadata fields that you can extract as a group from mail formats. This default metadata set is listed in the following table. When you retrieve *all* metadata for a file—that is, pass `NULL` for the array of metadata—the complete set of default metadata, not all available metadata in the file, is returned.

Default Mail Metadata List

Field Name (string to specify)	Description
From	The display name and email address of the sender.
Sent	The time that the message was sent.
To	The display names and email addresses of the recipients.
Cc	The display names and email addresses of recipients who receive copies of the email.
Bcc	The display names and email addresses of recipients who received blind copies of the email.
Subject	The text in the subject line of the message.
Priority	The priority applied to the message.

Because mail formats use different terms for the same fields, the format's reader maps the default field name to the appropriate format-specific name. For example, when retrieving the default metadata set, the NSF field *Importance* is mapped to the name *Priority* and is returned.

You can also extract the default field names individually by passing the field name (such as *From*, *To*, and *Subject*); however, in this case, the string is not mapped to the format-specific name. For example, if you pass *Priority* in the call, you retrieve the contents of the *Priority* field from an MBX file, but do not retrieve the contents of the *Importance* field from an NSF file.

NOTE: You cannot pass the field names listed in the table individually for PST files. However, you can pass either the MAPI tag number or the MAPI tag name as integers. See [Microsoft Personal Folders File \(PST\) Metadata, on page 59](#).

Extract the Default Metadata Set

To extract the default metadata set, call the `fpGetSubFileMetaData()` function, and pass `0` for `metaNameCount` and `NULL` for `metaNameArray`.

```
KVGetSubFileMetaArgRec metaArg;  
KVSubFileMetaData pMetaData = NULL;  
KVStructInit(&metaArg);  
  
metaArg.index = subFileIndex;  
metaArg.metaNameCount = 0;
```

```
metaArg.metaNameArray = NULL;

error = extractInterface->fpGetSubFileMetaData(pFile, &metaArg, &pMetaData);
...
extractInterface->fpFreeStruct(pFile,pMetaData);
pMetaData = NULL;
```

Microsoft Outlook (MSG) Metadata

In addition to the default metadata set, you can extract the metadata fields listed in the following table for MSG files. You must pass the field name to `metaNameArray` in the call to the `fpGetSubFileMetadata()` function.

MSG-specific Metadata List

Field Name (string to specify)	Description
AttachFileName	An attachment's long file name and extension, excluding the path.
ConversationTopic	The topic of the first message in a conversation thread. A conversation thread is a series of messages and replies. This is the first message's subject with any prefix removed.
CreationTime	The time that the message or attachment was created. This value is displayed in the Sent field in the message's Properties dialog in Outlook.
InternetMessageID	The identifier for messages that come in over the Internet. This is the MAPI property <code>PR_INTERNET_MESSAGE_ID</code> . This property is not in the MAPI headers or MAPI documentation.
LastModificationTime	The time that the message or attachment was last modified. This value is displayed in the Modified field in the message's Properties dialog in Outlook.
Location	The physical location of the event specified in the Outlook calendar entry.
MessageID	The message transfer system (MTS) identifier for the message transfer agent (MTA). This value is displayed on the Message ID tab in the message's Properties dialog in Outlook.
Received	The date and time a message was delivered. This value is displayed in the Received field in the message's Properties dialog in Outlook.
Sender	<p>The name and email address of the message sender. This value is a concatenation of two MAPI properties in the following format:</p> <pre>"PR_SENDER_NAME" <PR_SENDER_EMAIL_ADDRESS></pre> <p>The Sender value might be the same as or different than the default metadata <code>From</code> value (see Default Metadata Set, on the previous page), depending on which MAPI properties exist in the MSG file.</p>

MSG-specific Metadata List, continued

Field Name (string to specify)	Description
Sensitivity	The value indicating the message sender's opinion of the sensitivity of a message. For example, Personal, Private, or Confidential. This value is displayed in the Sensitivity field in the message's Properties dialog in Outlook.
TransportMsgHeaders	Transport-specific message envelope information. This value corresponds to the MAPI property PR_TRANSPORT_MESSAGE_HEADERS.
StartDate	An appointment start date. This value corresponds to the PR_START_DATE MAPI property.
EndDate	An appointment end date. This value corresponds to the PR_END_DATE MAPI property.

Extract MSG-Specific Metadata

To extract specific metadata fields from an MSG file, call the [fpGetSubFileMetaData\(\)](#) function, and pass the field name defined in [Default Metadata Set, on page 55](#) to metaNameArray (the string is not case sensitive).

For example, the following code extracts the contents of the ConversationTopic and MessageID fields:

```
KVGetSubFileMetaArgRec metaArg;
KVSubFileMetaData pMetaData = NULL;
KVStructInit(&metaArg);
KVMetaNameRec names[2];
KVMetaName pname[2];

names[0].type = KVMetaNameType_String;
names[0].name.sname = "conversationtopic";
names[1].type = KVMetaNameType_String;
names[1].name.sname = "MessageID";

pname[0] = &names[0];
pname[1] = &names[1];

metaArg.metaNameCount = 2;
metaArg.metaNameArray = pname;
metaArg.index = subFileIndex;

error = extractInterface->fpGetSubFileMetaData(pFile, &metaArg, &pMetaData);
...
extractInterface->fpFreeStruct(pFile, pMetaData);
pMetaData = NULL;
```

Microsoft Outlook Express (EML) and Mailbox (MBX) Metadata

In addition to the default metadata set, you can extract any metadata field that exists in the header of an EML or MBX file by passing the field's name. If the name is a valid field in the file, the content of the field is returned. For example, to retrieve the name of the last mail server that received the message before it was delivered, you can pass the string "Received".

Extract EML- or MBX-Specific Metadata

To extract specific metadata fields from an EML or MBX file, call the [fpGetSubFileMetaData\(\)](#) function, and pass the metadata name to `metaNameArray` (the string is *not* case sensitive).

For example, the following code extracts the contents of the `Received` and `Mime-version` fields:

```
KVGetSubFileMetaArgRec metaArg;
KVSubFileMetaData pMetaData = NULL;
KVStructInit(&metaArg);
KVMetaNameRec names[2];
KVMetaName pname[2];

names[0].type = KVMetaNameType_String;
names[0].name.sname = "Received";
names[1].type = KVMetaNameType_String;
names[1].name.sname = "Mime-version";

pname[0] = &names[0];
pname[1] = &names[1];

metaArg.metaNameCount = 2;
metaArg.metaNameArray = pname;
metaArg.index = subFileIndex;
error = extractInterface->fpGetSubFileMetaData(pFile, &metaArg, &pMetaData);
...
extractInterface->fpFreeStruct(pFile, pMetaData);
pMetaData = NULL;
```

Lotus Notes Database (NSF) Metadata

In addition to the default metadata set, you can extract any Lotus field name that exists in an NSF file by passing the field's name. (You can extract fields from mail NSF files and non-mail NSF files.) If the name is a valid field in the file, the field is returned. For example, to retrieve the date when a document in an NSF file was last accessed, you would pass the string "\$LastAccessedDB".

NOTE: A complete list of NSF fields is provided in the Lotus Notes file `stdnames.h`. This header file is available in the Lotus API Toolkit.

Extract NSF-Specific Metadata

To extract specific metadata fields from an NSF file, call the [fpGetSubFileMetaData\(\)](#) function, and pass the metadata name to `metaNameArray` (the string is *not* case sensitive).

For example, the following code extracts the contents of the `Description` and `Categories` fields:

```
KVGetSubFileMetaArgRec metaArg;
KVSubFileMetaData pMetaData = NULL;
KVStructInit(&metaArg);
KVMetaNameRec names[2];
KVMetaName pname[2];

names[0].type = KVMetaNameType_String;
names[0].name.sname = "description";
names[1].type = KVMetaNameType_String;
names[1].name.sname = "Categories";

pname[0] = &names[0];
pname[1] = &names[1];

metaArg.metaNameCount = 2;
metaArg.metaNameArray = pname;
metaArg.index = subFileIndex;

error = extractInterface->fpGetSubFileMetaData(pFile, &metaArg, &pMetaData);
...
extractInterface->fpFreeStruct(pFile, pMetaData);
pMetaData = NULL;
```

Microsoft Personal Folders File (PST) Metadata

In addition to the default metadata set, you can extract Messaging Application Programming Interface (MAPI) properties from a PST file. These properties describe all elements of an Outlook item in a PST file (such as subject, sender, recipient, and message text). Because the properties are stored in the PST file itself, you can retrieve them *before* you extract the contents of the PST. This enables you to determine whether an Outlook item should be extracted based on its attributes. Some MAPI properties are also stored for Outlook attachments that are *not* mail messages (such as an attached Microsoft Word document or Lotus 1-2-3 file).

NOTE: Because all elements of a message (except non-mail attachments) are represented by MAPI properties, you can extract all components of a subfile, including the header and message text, by calling the `fpGetSubFileMetadata()` function.

MAPI Properties

Each MAPI property is identified by a property tag, which is a constant that contains the property type and a unique identifier. For example, the property that indicates whether a message has attachments

has the following components:

Property	PR_HASATTACH
Identifier	0x0E1B
Property type	PT_BOOLEAN (000B)
Property tag	0x0E1B000B

The Microsoft MAPI documentation on the Microsoft Developer Network website lists all available MAPI properties, their tags, and types.

You can retrieve any MAPI property that is of one of the MAPI property types listed below:

PT_I2	PT_DOUBLE	PT_STRING8
PT_I4	PT_FLOAT	PT_TSTRING
PT_BINARY	PT_LONG	PT_SYSTIME
PT_BOOLEAN	PT_SHORT	PT_UNICODE

NOTE: Properties with a PT_TSTRING type have the property type recompiled to either a Unicode string (PT_UNICODE) or to an ANSI string (PT_STRING8) depending on the operating system's character set. To retrieve the Unicode property, pass in the Unicode version of the tag. For example, the property tag for PR_SUBJECT is either 0x0037001E for an ANSI string, or 0x0037001F for a Unicode string.

Extract PST-Specific Metadata

In the call to extract subfile metadata, you can pass either the MAPI tag number (such as 0x0070001e) or the MAPI tag name (such as PR_CONVERSATION_TOPIC). If you specify the MAPI tag name, you must include the mapitags.h and mapidefs.h Windows header files, in which the MAPI tag name is defined as a tag number.

To extract specific MAPI properties from a PST file, call the [fpGetSubFileMetaData\(\)](#) function, and pass the property tag to metaNameArray. The tag is passed as an integer.

For example, the following code extracts the MAPI properties PR_SUBJECT and PR_ALTERNATE_RECIPIENT:

```
KVGetSubFileMetaArgRec metaArg;  
KVSubFileMetaData pMetaData = NULL;  
KVMetaNameRec names[2];  
KVMetaName pName[2];  
  
names[0].type = KVMetaNameType_Integer;  
names[0].name.iname = PR_SUBJECT;  
  
names[1].type = KVMetaNameType_Integer;  
names[1].name.iname = 0x3A010102;  
  
pName[0] = &names[0];  
pName[1] = &names[1];
```

```
KVStructInit(&metaArg);

metaArg.metaNameCount = 2;
metaArg.metaNameArray = pName;
metaArg.index = SubFileIndex;

error = extractInterface->fpGetSubFileMetaData (pFile,&metaArg,&pMetaData);
...
extractInterface->fpFreeStruct(pFile,pMetaData);

pMetaData = NULL;
```

NOTE: You must include the `mapitags.h` and `mapidefs.h` Windows header files, in which `PR_SUBJECT` is defined as `0x0037001E`.

Exclude Metadata from the Extracted Text File

When you extract a mail message, the message text and header information (To, From, Sent, and so on) is also extracted. You can prevent the header information from appearing in the text file.

To exclude the header information, set `extractFlag` to `KVExtractionFlag_ExcludeMailHeader` in the call to [fpExtractSubFile\(\)](#).

Extract Subfiles from Outlook Files

When you extract an Outlook file (MSG) to disk, the message text and header information (To, From, Sent, and so on) is extracted to a text file. (If you do not want the header information to appear in the text file, see [Exclude Metadata from the Extracted Text File, above](#).) If the Outlook file contains a non-mail attachment, the attachment is extracted in its native format to a subdirectory. If the Outlook file contains a mail attachment, the attachment's message text is extracted to a subdirectory.

Extract Subfiles from Outlook Express Files

When you extract an Outlook Express (EML) file to disk, the message text and header information (To, From, Sent, and so on) is extracted to a text file. (If you do not want the header information to appear in the text file, see [Exclude Metadata from the Extracted Text File, above](#).) If the Outlook file contains a non-mail attachment, the attachment is extracted in its native format to the same directory as the message text file. If the Outlook file contains a mail attachment, the complete attachment (including message text and attachments), the message text file, and any non-mail attachments are extracted to the same directory as the main message.

NOTE: When the MBX reader (`mbxsr`) is enabled, it is used to filter MBX *and* EML files. If the MBX reader is not enabled, the EML reader (`emlsr`) is used.

Extract Subfiles from Mailbox Files

A Mailbox (MBX) file is a collection of individual emails compiled with RFC 822 and RFC 2045 - 2049 (MIME), and divided by message separators. There are many mail applications that export to an MBX format, such as Eudora Email and Mozilla Thunderbird.

When an MBX file is extracted to disk, the message text and header information (To, From, Sent, and so on) from each mail file is extracted to text files. (If you do not want the header information to appear in the text file, see [Exclude Metadata from the Extracted Text File, on the previous page.](#))

In Eudora MBX files, attachments are inserted as a link and are stored externally from the message. These attachments are not extracted, but the path to the attachment is returned in the call to the [fpGetSubFileInfo\(\)](#) function. You can write code to retrieve the attachment based on the returned path.

For MBX files from other clients, KeyView extracts attachments when they are embedded in the message.

The Mailbox (MBX) reader is an advanced feature and is sold and licensed separately. To enable this reader in a KeyView SDK, you must obtain the appropriate license key from Micro Focus. See [Update License Information, on page 22](#) for information on adding a new license key to an existing installation.

Extract Subfiles from Outlook Personal Folders Files

KeyView can extract Outlook items such as messages, appointments, contacts, tasks, notes, and journal entries from a PST file. When a PST file is extracted to disk, the text and header information (To, From, Sent, and so on) from each Outlook item is extracted to a text file. (If you do not want the header information to appear in the text file, see [Exclude Metadata from the Extracted Text File, on the previous page.](#))

You can also extract messages from PST files as MSG files, including all their attachments, by setting the `KVExtractionFlag_SaveAsMSG` flag in the [KVExtractSubFileArg](#) structure when you call `fpExtractSubFile()`.

If an Outlook item contains a non-mail attachment, the attachment is extracted in its native format to a subdirectory. If an Outlook item contains an Outlook attachment, the attached item's text and any attachments are extracted to a subdirectory.

NOTE: The Microsoft Outlook Personal Folders (PST) reader is an advanced feature and is sold and licensed separately. To enable this reader in a KeyView SDK, you must obtain the appropriate license key from Micro Focus. See [Update License Information, on page 22](#) for information on adding a new license key to an existing installation.

Use the Native or MAPI-based Reader

KeyView accesses PST files in one of two ways:

- indirectly using the Microsoft Messaging Application Programming Interface (MAPI) reader named `pstsr`.
- directly using the native PST reader named `pstnsr`.

On UNIX platforms, the native reader is always used to process PST files because the MAPI-based reader only runs on Windows x86 and x64. On Windows, you can specify either reader; however, the MAPI-based reader is used by default.

The differences between the two readers are summarized in the following table:

Feature/Requirement	Native Reader (pstnsr)	MAPI-based Reader (pstsrr)
All platforms supported	Yes	Windows x86 and x64 only
Outlook client required	No	Yes
MAPI properties supported	Yes All properties defined in mapitags.h. Object properties are not supported.	Yes All properties defined in mapitags.h. Object properties are not supported.
Password protection supported	Yes	Yes (using KVCredential structure)
Compressible encryption supported	Yes	Yes
High encryption supported	No	Yes

To use the MAPI-based reader for PST files, change the PST entry in the `formats_e.ini` file as follows:

```
297=pst
```

To use the native reader for PST files, change the PST entry in the `formats_e.ini` file as follows:

```
297=pstn
```

NOTE: You must make sure that the PST that you are extracting is not open in the Outlook client, and that the Outlook process is not running.

Use the Native PST Reader (pstnsr)

The native PST reader accesses PST files directly without relying on the Microsoft interface to the PST format. It runs on both Windows and UNIX, and does not require an Outlook client on the system processing the PST files. However, the native reader does not support password-protected PST files that use high encryption.

Use the MAPI Reader (pstsrr)

The `pstsrr` reader accesses PST files indirectly by using Microsoft's Messaging Application Programming Interface (MAPI). MAPI is a standard Windows message interface that enables different mail programs and other mail-aware applications (such as word processors and spreadsheets) to exchange messages and attachments with each other. MAPI allows KeyView to open a PST file, traverse the folders and Outlook items, and extract the items inside the PST file.

NOTE: When extracting subfiles from PST files, information on the distribution list used in an email is extracted to a file called `emailname.dist`. This applies to the MAPI reader (`pstsr`) only.

System Requirements

Because MAPI is supported on Windows platforms only, you can convert PST files on Windows only. Because MAPI relies on functionality in Microsoft Outlook, a Microsoft Outlook client must be installed on the same machine as the application converting PST files, and must be the default email application. KeyView supports the following PST formats and Outlook clients:

- Outlook 97 or higher PST files
- Outlook 2002 or later clients

NOTE: The Outlook client must be the same version as, or newer than, the version of Outlook that generated the PST file.

NOTE: The bit edition of Microsoft Outlook must match that of the KeyView software. For example, if 32-bit KeyView is used, 32-bit Outlook must be installed. If 64-bit KeyView is used, 64-bit Outlook must be installed.

If the bit editions do not match, an error message from Microsoft Office Outlook is displayed:

```
Either there is a no default mail client or the current mail client cannot  
fulfill the messaging request. Please run Microsoft Outlook and set it as the  
default mail client.
```

Additionally, KeyView displays the following return code:

```
Error 32: KVErrror_PSTAccessFailed.
```

MAPI Attachment Methods

The way in which you can access the contents of a PST message attachment is determined by the MAPI *attachment method* applied to the attachment. For example, if the attachment is an embedded OLE object, it uses the `ATTACH_OLE` attachment method. KeyView can access message attachments that use the following attachment methods:

`ATTACH_BY_VALUE`

`ATTACH_EMBEDDED_MSG`

`ATTACH_OLE`

`ATTACH_BY_REFERENCE`

`ATTACH_BY_REF_ONLY`

`ATTACH_BY_REF_RESOLVE`

Attachments using the `ATTACH_BY_VALUE`, `ATTACH_EMBEDDED_MSG`, or `ATTACH_OLE` attachment methods are extracted automatically when the PST file is extracted. An "attach by reference" method

means that the attachment is not in Outlook, but Outlook contains an absolute path to the attachment. Before you can extract these types of attachments, you must retrieve the path to access the attachment.

To extract "attach by reference" attachments

Determine whether the attachment uses an `ATTACH_BY_REFERENCE`, `ATTACH_BY_REF_ONLY`, or `ATTACH_BY_REF_RESOLVE` method by retrieving the MAPI property `PR_ATTACH_METHOD`.

If the attachment uses one of the "attach by reference" methods, get the fully qualified path to the attachment by retrieving the MAPI properties `PR_ATTACH_LONG_PATHNAME` or `PR_ATTACH_PATHNAME`.

You can then either copy the files from their original location to the path where the PST file is extracted, or use the Export API functions to convert the attachment.

Open Secured PST Files

KeyView enables you to specify a user name and password to use to open a secured PST file for extraction.

NOTE: To open password-protected PST files that use high encryption, you must use the MAPI-based PST reader (`pstsr`).
The native PST reader (`pstnsr`) returns the error message `KVERR_PasswordProtected` if a PST is encrypted with high encryption.

Detect PST Files While the Outlook Client is Running

If you are running an Outlook client while running the File Extraction API, the KeyView format detection module (`kwad`) might not be able to open the PST file to determine the file's format because Outlook has the file locked. In this case, you can do one of the following:

- Close Outlook when using the Extraction API.
- Detect PST files by extension only and bypass the format detection module. To enable this option, add the following lines to the `formats_e.ini` file:

```
[container_flags]
detectPSTbyExtension=1
```

NOTE: The `detectPSTbyExtension` option applies only when you are using the MAPI reader (`pstsr`).

NOTE: If you use this option, you must make sure in your code that valid PST files are passed to KeyView, because the format detection module is not available to verify the file type and pass the file to the appropriate reader.

Extract Subfiles from Lotus Domino XML Language Files

When you extract a Lotus Domino XML Language (.DXL) file, the message text and header information (*To*, *From*, *Sent*, and so on) is extracted to a text file.

NOTE: To prevent header information from being extracted, see [Exclude Metadata from the Extracted Text File, on page 61](#).

You can make sure that dates and times extracted from Lotus Domino .DXL files are displayed in a uniform format.

To extract custom date/time formats

- In the `formats_e.ini` file, set the `DateTimeFormat` option in the `[dxlsr]` section. For example:

```
[dxlsr]
DateTimeFormat=%m/%d/%Y %I:%M:%S %p
```

In this example, dates and times are extracted in the following format:

02/11/2003 11:36:09 AM

The format arguments are the same as those for the `strftime()` function. See <http://msdn.microsoft.com/en-us/library/fe06s4ak%28VS.71%29.aspx> for more information.

Extract .DXL Files to HTML

You can use the file extraction API to process .DXL files with an XSLT engine. The XSLT engine then transforms the extracted .DXL to .mail HTML files.

To extract .DXL files to HTML

- Set the following options in the `formats_e.ini` file:

```
[nsfsr]
ExportDXL=1
ExportDXL_PureXML=1

[dxlsr]
LNDDParser=2
```

Extract Subfiles from Lotus Notes Database Files

A Lotus Notes database is a single file that contains multiple documents called *notes*. Notes include design notes (such as forms, views, folders, navigators, outlines, pages, framesets, agents, and resources), data document notes, profile document notes, access control list notes, and collection (index) notes. KeyView can extract text items, attachments, and OLE objects from *data document notes* only. Data document notes include emails, journal entries, discussion threads, documents (Microsoft Office and Lotus SmartSuite), and so on.

All components of a note are prefixed by field names such as "SendTo:", "Subject:", and "Body:". When a note is extracted, the field names are not included in the extracted output; only the field values are extracted.

When a mail message in an NSF file is extracted to disk, the body text and header information (such as the values from the `SendTo`, `From`, and `DeliveredDate` fields) in each message is extracted to a text file. (If you do not want the header information to appear in the message text file, see [Exclude Metadata from the Extracted Text File, on page 61](#).)

NOTE: The Lotus Notes Database (NSF) reader is an advanced feature and is sold and licensed separately. To enable this reader in a KeyView SDK, you must obtain the appropriate license key from Micro Focus. See [Update License Information, on page 22](#) for information on adding a new license key to an existing installation.

System Requirements

The NSF format is proprietary. Therefore, KeyView accesses NSF files indirectly by using the Lotus Notes API. Because the NSF reader relies on functionality in Lotus Notes, a Lotus Notes client or Lotus Domino server must be installed and configured on the same machine as the application converting NSF files. On UNIX and Linux, the Lotus Domino server is required. On Windows, the Lotus Notes client or Lotus Domino server is required.

KeyView supports the following Lotus Notes clients and Domino servers:

- Lotus Notes 6.5.1
- Lotus Domino 6.5.1

KeyView supports NSF files on the same platforms supported by Lotus Notes and Lotus Domino:

- Windows XP x86 (Service Pack 1 and 2)
- Windows 2000 x86 (Service Pack 2)
- Solaris 8.0 and 9.0 (built on Solaris 8.0)
- Red Hat Enterprise Linux AS 3.0 (x86)
- SuSE Linux Enterprise Server 8 and 9 (x86)
- IBM AIX 5.1, 5L version 5.2

Installation and Configuration

Before KeyView can convert NSF files, you must set up the Lotus Notes client or Lotus Domino server. Full configuration is not required. The following steps outline the minimal setup for NSF conversion:

Windows

1. Install the Lotus Notes client or Lotus Domino server. You do not need to configure the client or server.
2. Make sure that the `notes.ini` file is in the proper location.
 - If Lotus Notes is installed, the file should appear in the `install\lotus\notes` directory, where `install` is the installation directory.
 - If only Lotus Domino is installed, the file should appear in the `install\lotus\domino` directory, where `install` is the installation directory.

If the file does not exist, create an ASCII file named `notes.ini`, and add the following text:

```
[Notes]
```

3. Add the KeyView `bin` directory and the `install\lotus\notes` or `install\lotus\domino` directory to the `PATH` environment variable (the KeyView `bin` directory must be first in the path).

Micro Focus recommends that you add the KeyView bin directory because the Lotus Notes or Domino server installation might contain older KeyView OEM libraries.

Solaris

1. Install Lotus Domino server. You do not need to configure the server.
2. Make sure that the `notes.ini` file is in the `install/lotus/notes/latest/sunspa` directory, where `install` is the directory where Lotus Notes is installed. If the file does not exist, create an ASCII file named `notes.ini`, and add the following text:

```
[Notes]
```

3. Add the `install/lotus/notes/latest/sunspa` directory to the PATH environment variable:

```
setenv PATH install/lotus/notes/latest/sunspa:$PATH
```

4. Add the `install/lotus/notes/latest/sunspa` and the KeyView bin directory to the LD_LIBRARY_PATH environment variable:

```
setenv LD_LIBRARY_PATH keyview_bin:install/lotus/notes/latest/sunspa:$LD_LIBRARY_PATH
```

where `keyview_bin` is the location of the KeyView bin directory. Micro Focus recommends that you add the KeyView bin directory because the Lotus Notes installation might contain older KeyView OEM libraries.

AIX 5.x

1. Install the `bos.iocp.rte` file set if it is not already installed, and reboot the machine. See the Lotus Domino server documentation for more information.
2. Install Lotus Domino server. You do not need to configure the server.
3. Make sure that the `notes.ini` file is in the `install/lotus/notes/latest/ibmpow` directory, where `install` is the directory where Lotus Notes is installed. If the file does not exist, create an ASCII file named `notes.ini`, and add the following text:

```
[Notes]
```

4. Add the `install/lotus/notes/latest/ibmpow` directory to the PATH environment variable:

```
setenv PATH install/lotus/notes/latest/ibmpow:$PATH
```

5. Add the `install/lotus/notes/latest/ibmpow` and the KeyView bin directory to the LIBPATH environment variable:

```
setenv LIBPATH keyview_bin:install/lotus/notes/latest/ibmpow:$LIBPATH
```

where `keyview_bin` is the location of the KeyView bin directory. Micro Focus recommends that you add the KeyView bin directory because the Lotus Notes installation might contain older KeyView OEM libraries.

Linux

1. Install Lotus Domino server. You do not need to configure the server.
2. Make sure that the `notes.ini` file is in the `install/lotus/notes/latest/linux` directory, where `install` is the directory where Lotus Notes is installed. If the file does not exist, create an ASCII file named `notes.ini`, and add the following text:

```
[Notes]
```

3. Add the `install/lotus/notes/latest/linux` directory to the PATH environment variable:

```
setenv PATH install/lotus/notes/latest/linux:$PATH
```

4. Add the `install/lotus/notes/latest/linux` and the KeyView bin directory to the LD_LIBRARY_PATH environment variable:

```
setenv LD_LIBRARY_PATH keyview_bin:install/lotus/notes/latest/linux:$LD_LIBRARY_PATH
```

where `keyview_bin` is the location of the KeyView bin directory. Micro Focus recommends that you add the KeyView bin directory because the Lotus Notes installation might contain older KeyView OEM libraries.

Open Secured NSF Files

KeyView enables you to specify a user ID file and password to use to open a secured NSF file for extraction.

Format Note Subfiles

The KeyView NSF reader uses XML templates to format note subfiles. You can customize the templates to approximate the look and feel of the original notes as closely as possible. For more information, see [Extract and Format Lotus Notes Subfiles, on page 346](#).

Extract Subfiles from PDF Files

KeyView can extract document-level and page-level attachments from a PDF document. Document-level attachments are added by using the **Attach A File** tool, and can include links to or from the parent document or to other file attachments. Page-level attachments are added as comments by using various tools. Page-level or comment attachments display the File Attachment icon or the Speaker icon on the page where they are located.

When a PDF's attachments are extracted to disk, the attachments are saved in their native format.

Improve Performance for PDFs with Many Small Images

To improve performance when processing PDF files that contain many small images, you can choose to ignore images unless they exceed a minimum width and/or height. If an image is smaller than the

minimum width or height, KeyView does not extract the image.

For example, to ignore images that are less than 16 pixels wide or less than 16 pixels in height, add the following to the [pdf_flags] section of the formats_e.ini file:

```
[pdf_flags]
process_images_with_min_width=16
process_images_with_min_height=16
```

Extract Embedded OLE Objects

Embedded OLE objects can be converted in two ways:

- Using the File Extraction API, the OLE object is first extracted from the main file and saved to disk. It can then be converted by making a separate conversion call.
- Using the HTML Export API, the main file is converted to HTML and the OLE object is converted to a graphics file that is referenced in the HTML file .

The File Extraction API can extract embedded OLE objects from the following types of documents:

- Lotus Notes (DXL)
- Microsoft Excel
- Microsoft Word
- Microsoft PowerPoint
- Microsoft Outlook
- Microsoft Visio
- Microsoft Project
- OASIS Open Document
- Rich Text Format (RTF)

When an embedded OLE object is extracted from its parent file, the location of the embedded file in the original document is not available. The parent and child are extracted as separate files.

Extract Subfiles from ZIP Files

You can extract ZIP files that are not password-protected by using the general method (see [Extract Subfiles, on page 52](#)). However, some ZIP files use password protection, in which case you must use a different method to enter the required credentials.

Default File Names for Extracted Subfiles

When you do not specify a file name in the call to [fpExtractSubFile\(\)](#), in some cases a default file name is applied to the extracted subfile.

Default File Name for Mail Formats

To avoid naming conflicts and problems with long file names, KeyView applies its own names to the extracted mail items when you do not supply a name in the call to `fpExtractSubFile()`. A non-mail attachment retains its original file name and extension.

When the contents of a mail store or the message body of a mail message are extracted, the extracted file names can include the following:

- The first valid eight characters of the original folder name or "Subject" line of the mail message. If the "Subject" line is empty, the characters `kvext` are used, where `ext` is the format's extension. For example, the characters would be `"kvmsg"` for MSG and `"kvnsf"` for NSF.

For notes, the file name is derived from the first 24 characters of the note text. For contact entries, the file name is derived from the full name of the contact.

The following special characters are considered invalid and are ignored:

any non-printing character with a value less than `0x1F`

angle brackets (< >)	double quotation marks (")
asterisk (*)	forward slash (/)
back slash (\)	pipe ()
colon (:)	question mark (?)

- The characters `_kvn`, where `n` is an integer incremented from 0 for each extracted item.
- One of the following extensions:

Type	File Extension
email message	<code>.mail</code>
calendar appointment	<code>.cal</code>
contact entry	<code>.cont</code>
task entry	<code>.task</code>
note	<code>.note</code>
journal entry	<code>.jrn1</code>
distribution list	<code>.dist</code>
posting note	<code>.post</code>

- If the type cannot be determined for an MSG or PST file, the file is given a `.mail` extension.
- If the type cannot be determined for a NSF file, the file is given a `.tmp` extension.
- The format of a MAIL file is plain text by default, but can be set to RTF with the `KVExtractionFlag_GetFormattedBody` flag.

For example, an MSG mail message with the subject line *RE: Product roadmap* that contains the Microsoft Excel attachment `release_schedule.xls` is extracted as:

```
RE produ_kv0.mail  
release_schedule.xls
```

If an extracted message contains an embedded OLE object or any attachment that does not have a name, the object or attachment is extracted as `_kv#.tmp`.

Default File Name for Embedded OLE Objects

KeyView can apply a default name to an extracted embedded OLE object when you do not supply a name in the call to `fpExtractSubFile()`. When an embedded OLE object is extracted, the extracted file name can include the following:

- The characters `subfile_kvn`, where *n* is an integer incremented from 0 for each extracted object.
- If KeyView can determine the embedded OLE is a Microsoft Office document, the original extension is used. If the file type cannot be determined, the file is given a `.tmp` extension.

For example, a Microsoft Word document (`sales_quarterly.doc`) might contain two embedded OLE objects: a Microsoft Excel file called `west_region.xls`, and a bitmap created in the Word document. The embedded objects are extracted as `subfile_kv0.xls` and `subfile_kv1.tmp`.

Chapter 4: Use the HTML Export API

This section describes how to perform some basic tasks by using the HTML Export API.

• Extract Metadata	73
• Extract File Format Information	76
• Convert Character Sets	76
• Map Styles	81
• Use Style Sheets	84
• Display Vector Graphics on UNIX and Linux	84
• Search and Highlight Terms	85
• Include Revision Information	86
• Extract Text from Text Boxes	89
• Convert PDF Files	89
• Convert Spreadsheet Files	99
• Convert Presentation Files	103
• Convert XML Files	104
• Show Hidden Data	108
• Exclude Japanese Guide Text	111

Extract Metadata

When a file format supports metadata, KeyView can extract and process that information. Metadata includes document information fields such as title, author, creation date, and file size. Depending on the file's format, metadata is referred to in a number of ways: for example, "summary information," "OLE summary information," "file information," and "document properties."

The metadata in mail formats (MSG and EML) and mail stores (PST, NSF, and MBX) is extracted differently than other formats. For information on extracting metadata from these formats, see [Extract Mail Metadata, on page 54](#).

NOTE: KeyView can extract metadata from a document only if metadata is defined in the document, and if the document reader can extract metadata for the file format. The section [Supported Formats, on page 276](#) lists the file formats for which metadata can be extracted. KeyView does not generate metadata automatically from the document contents.

Extract Metadata by Using the API

You can extract the metadata at the API level. The API extracts all valid metadata fields that exist in the file.

Use the C API

To extract metadata by using the C API

1. Declare a pointer to the `KVSummaryInfoEx` structure. [KVSummaryInfoEx](#), on page 198.
2. Call the `fpGetSummaryInfo()` function. See [fpGetSummaryInfo\(\)](#), on page 165.

Use the COM interface

To extract metadata by using the COM interface, call the `GetSummaryInfo()` method. See [GetSummaryInfo](#), on page 249.

Extract Metadata by Using a Template File

When using a template file, KeyView recognizes two types of metadata: *standard* and *non-standard*. Standard metadata includes fields, such as Title, Author, and Subject. The standard fields are enumerated from 1 to 41 in `KVSumType` in the header file `kvtypes.h`. Non-standard metadata includes any field not listed from 1 to 41 in `KVSumType`, such as user-defined fields (for example, custom property fields in Microsoft Word documents), or fields that are unique to a particular file type (for example, "Artist" or "Genre" fields in MP3 files). Enumerated types 42 and greater are reserved for non-standard metadata.

To extract metadata by using a template file

1. Insert metadata tokens in a member of the `KVHTMLTemplateEx` structure in the template file. This defines the point at which the metadata appears in the HTML output.
2. If you are using the `$USERSUMMARY` or `$SUMMARY` token, define the `szUserSummary` member of the `KVHTMLTemplateEx` structure in the template file. This determines the markup and tokens generated when these metadata tokens are processed.
3. In your application, read the template file and write the data to the `KVHTMLTemplateEx` structure.
See [htmlini](#), on page 118.

The following metadata tokens can be used in the template files:

Token	Description
<code>\$SUMMARYNN</code>	Inserts the data from a <i>specified</i> metadata field. <i>NN</i> is a number from 00 through 42 enumerated in <code>KVSumType</code> in <code>kvtypes.h</code> .
<code>\$SUMMARY</code>	Inserts the data from valid metadata fields in the range of 0 to 33 using the markup provided in <code>pszUserSummary</code> .
<code>\$USERSUMMARY</code>	Inserts the data from <i>every</i> valid non-standard metadata field using the markup provided in <code>pszUserSummary</code> .
<code>\$CONTENT</code>	Inserts the content of the metadata field specified by the <code>\$NAME</code> token.
<code>\$NAME</code>	Inserts the name of a the metadata field, such as "Title," "Author," or "Subject."

Depending on the markup in `szUserSummary`, the extracted metadata might not appear in the browser when the HTML file is displayed, but might appear in the output file. Most of the KeyView-supplied template files extract standard metadata from a document, and include it in the output HTML. However, they do not display the metadata in a browser.

Examples

\$SUMMARYNN

The following markup displays the contents of the "Title" field at the top of the main HTML file:

```
szMainTop=<em><strong>$SUMMARY01</strong></em>
```

In `KVSumType`, 01 is the enumerated value for the "Title" metadata field.

\$SUMMARY

The following markup extracts all standard fields, and includes them in the first heading level 1 HTML block:

```
szFirstH1Start=$SUMMARY
```

```
szUserSummary=<meta name="$NAME" content="$CONTENT" />
```

This example extracts the field name (`$NAME`) and field content (`$CONTENT`) for standard metadata from a document, and includes it at the beginning of the first Heading level 1 HTML block. However, it does not display the metadata in the browser. The HTML output might look like this:

```
<meta name="CodePage" content="1252" />
<meta name="Title" content="My design document" />
<meta name="Subject" content="design specifications" />
<meta name="Author" content="John Doe" />
<meta name="Keywords" content="" />
<meta name="Comments" content="" />
<meta name="Template" content="Normal.dot" />
<meta name="LastAuthor" content="lchapman" />
<meta name="RevNumber" content="6" />
<meta name="EditTime" content="01/01/1601, 0:08" />
<meta name="LastPrinted" content="14/01/2002, 14:06" />
<meta name="Create_DTM" content="27/08/2003, 10:31" />
<meta name="LastSave_DTM" content="29/08/2003, 14:07" />
<meta name="PageCount" content="1" />
<meta name="WordCount" content="4062" />
<meta name="CharCount" content="23159" />
<meta name="AppName" content="Microsoft Word 9.0" />
<meta name="Security" content="0" />
<meta name="Category" content="software" />
<meta name="LineCount" content="192" />
<meta name="ParCount" content="46" />
<meta name="ScaleCrop" content="FALSE" />
<meta name="Manager" content="" />
<meta name="Company" content="Autonomy" />
```

To display the metadata in a browser, use the following markup in `szUserSummary`:

```
<hr>name="$NAME" content="$CONTENT" <br>/>
```

\$USERSUMMARY

The following markup extracts non-standard fields, and includes them at the bottom of the main HTML file:

```
szMainBottom=$USERSUMMARY
```

```
szUserSummary=<meta name="$NAME" content="$CONTENT" />
```

This example extracts the field name (`$NAME`) and field content (`$CONTENT`) for non-standard metadata from a document, and includes it at the bottom of the main HTML file. However, it does not display the metadata in the browser. The HTML output might look like this:

```
meta name="Telephone number" content="444-111-2222"
meta name="Recorded date" content="07/03/2003, 23:00"
meta name="Source" content="TRUE"
meta name="my property" content="reserved"
```

To display the metadata in a browser, use the following markup in `szUserSummary`:

```
<hr>name="$NAME" content="$CONTENT" <br>/>
```

Extract File Format Information

Export can detect a file's format, and report the information to the API, which in turn reports the information to the developer's application. This feature enables you to apply customized conversion settings based on a file's format. See [File Format Detection, on page 362](#) for more information on format detection.

Use the C API

To extract file format information by using the C API

1. Declare a pointer to the `KVStreamInfo` data structure. [KVStreamInfo, on page 195](#).
2. Call the `fpGetStreamInfo()` function. [fpGetStreamInfo\(\), on page 165](#).

Use the COM interface

To extract file format information by using the COM interface, call the `GetFileInfo()` method. See [GetFileInfo, on page 248](#).

Convert Character Sets

Export allows you to control the character set of both the input and the output text. This is accomplished by either

- setting the source and/or target character set in the API, or
- basing the input/output on the character set of the document (if the document character set is stored in the document and can be determined by the document reader).

The character sets are enumerated in `KVCharSet` of `kvtypes.h`. Not all character sets can be used to specify the target character set. See [Code Character Sets, on page 316](#) for a list of character sets that can be used as a target character set.

Determine the Character Set of the Output Text

To determine the output character set of a converted document, Export considers the following:

- Whether the reader can extract the character set from the document. This depends on whether the file format can provide character set information and whether the document actually contains character set information.

The section [Supported Formats, on page 276](#) indicates the file formats for which character set information can be extracted. If character set information cannot be determined for your document type, you must set the source, the target character set, or both, in the API.

- Whether a source character set is set in the API.

NOTE: To set the source character set, you must specify a character set *and* set the `bForceSrcCharSet` member of the `KVHTMLOptionsEx` structure to `TRUE`.

- Whether a target character set is set in the API.

NOTE: To set the target character set, you must specify a character set *and* set the `bForceOutputCharSet` member of the `KVHTMLOptionsEx` structure to `TRUE`.

Guidelines for Character Set Conversion

The following diagram shows how the output character set is determined when the document character set can be determined:

Document Character Set Can Be Determined

The following diagram shows how the output character set is determined when the document character set cannot be determined:

Document Character Set Cannot Be Determined

Examples of Character Set Conversion

The examples below demonstrate possible configurations for mapping character sets and the expected output for each scenario.

Document Character Set Can be Determined

For the example in the following table, the document is an RTF file. The section [Word Processing Formats, on page 296](#) indicates that the document character set *can* be obtained from this file type. The document character set is Traditional Chinese (BIG5).

Document character set can be determined

Source charset set	Target charset set	Output charset
KVCS_GB	KVCS_UTF8	KVCS_UTF8 Converts GB (Simplified Chinese) to UTF-8. The output character set is the target character set specified in the API.
KVCS_GB	--	KVCS_GB Converts BIG5 to GB (Simplified Chinese). The output character set is the source character set specified in the API.
--	KVCS_UTF8	KVCS_UTF8 Converts BIG5 to UTF-8. The output character set is the target character set specified in the API.
--	--	KVCS_BIG5 The output character set is the document character set. No conversion.

Document Character Set Cannot be Determined

For the example in the following table, the document is an ASCII file. The section [Word Processing Formats, on page 296](#) indicates that the document character set *cannot* be obtained from this file type. The document character set is KVCS_1251.

Document character set cannot be determined

Source charset set	Target charset set	Output charset
KVCS_1252	KVCS_UTF8	KVCS_UTF8 Converts KVCS_1252 to KVCS_UTF8. The output character set is the target character set specified in the API.
KVCS_1252	KVCS_UNKNOWN	KVCS_1252 The output character set is the source character set specified in the API because KVCS_UNKNOWN cannot be used. No conversion.

Document character set cannot be determined, continued

Source charset set	Target charset set	Output charset
KVCS_1252	--	KVCS_1252 The output character set is the source character set specified in the API. No conversion.
--	KVCS_1252	KVCS_1252 Converts OS code page to KVCS_1252. The output character set is the target character set specified in the API.
--	--	The output character set is OS code page. No conversion.

Set the Character Set During Conversion

You can convert the character set of a file at the time the file is converted.

To specify the source character set for documents from which the document character set cannot be obtained by the reader

1. Set the `eSrcCharSet` member of the `KVHTMLOptionsEx` structure to one of the character sets enumerated in `KVCharSet` in `kvtypes.h`. See [KVHTMLOptionsEx, on page 208](#).
2. Set the `bForceSrcCharSet` member of the `KVHTMLOptionsEx` structure to `TRUE`. See [KVHTMLOptionsEx, on page 208](#).

To specify the target character set

1. Set the `OutputCharSet` member of the `KVHTMLOptionsEx` structure to one of the character sets enumerated in `KVCharSet` in `kvtypes.h`. [KVHTMLOptionsEx, on page 208](#).
2. Set the `bForceOutputCharSet` member of the `KVHTMLOptionsEx` structure to `TRUE`. See [KVHTMLOptionsEx, on page 208](#).

Set the Character Set During File Extraction from a Container

You can convert the character set of a container subfile at the time the subfile is extracted from the container and before it is converted to HTML. This is most often used to set the output character set of a mail message's body text. See [Use the HTML Export API, on page 73](#).

To specify the source character set of a subfile, call the `fpExtractSubFile()` function, and set the `KVExtractSubFileArg->srcCharSet` argument to any value in the enumerated list in `KVCharSet` of `kvtypes.h`. See [fpExtractSubFile\(\), on page 130](#).

To specify the target character set of a subfile, call the `fpExtractSubFile()` function, and set the `KVExtractSubFileArg->trgCharSet` argument to any value in the enumerated list in `KVCharSet` of `kvtypes.h`.

Map Styles

Export can map paragraph and character styles in any word processing format that contains styles (such as Microsoft Word, RTF, or Folio Flat File) to user-defined markup. This feature is useful for shaping the look of the HTML output, or for generating user-defined metadata (including using XML tags) for indexing, searching, and navigation. With this feature, you can redact (hide) text in the source document, delete content, or change the overall structure of the output. You can also embed style sheet styles in the output defined in the HTML.

To enable style mapping, you must indicate which paragraph and/or character styles are to be mapped, and define the starting and ending markup to be included in the HTML output.

For example, if the source Microsoft Word document contains the character style "Recipe," and the content of the style in Microsoft Word is "Brownies," you can specify that the starting markup be `<recipe>` and the ending markup `</recipe>`. This would result in the output HTML containing:
`<recipe>Brownies</recipe>`.

You can also use style mapping to control the look of the HTML output either by using a Cascading Style Sheet (CSS) or by defining the style directly in the starting markup. For example, if a Word document contains the paragraph style "Colorful", you can have markup of the form `<p><div class="rainbow">` inserted at the front of the paragraph and markup of the form `</div></p>` inserted at the end of the paragraph. "Rainbow" is a CSS style defined in an externally provided CSS file referenced at the top of the HTML output.

Style mapping is enabled in the `wordstyle.ini` template file. The HTML Export Getting Started page demonstrates the output resulting from a conversion with `wordstyle.ini`. The Getting Started page, named `htmstart.html`, is in the directory `install\htmlexport\docs`, where `install` is the path name of the Export installation directory. The source documents used in the page are in the directory `install\testdocs`.

NOTE: When the user-defined markup in `KVStyle` conflicts with other markup generated by Export, the user-defined markup takes precedence.

Use the C API

To map styles by using the C API

1. Define the `KVStyle` structure. See [KVStyle](#), on page 197. The information in this structure includes:
 - the markup to be added to the beginning and end of a paragraph or character style.
 - the name of the word processing style (for example, "Heading 1") to which style mapping applies. Style names are case sensitive.
 - the flag which defines instructions on how to process the content associated with a paragraph or character style. The flags are defined in `kvtypes.h` and described in [Flags for Defining Styles](#), on page 83.
2. Call the `fpSetStyleMapping()` function. See [fpSetStyleMapping\(\)](#), on page 168.

Use a Template file

To map styles by using a template file

1. Use the `KVStyle` parameter to specify how many styles are being mapped. For example, if there are nine mapped heading levels, add the following:

```
[KVStyle]
NumStyles=9
```

2. For each style, there must be a `[StyleX]` entry that contains the markup that appears at the start and end of the defined style. For example, in the `wordstyle.ini` sample file, the first heading level is defined as follows:

```
[Style1]
StyleName=Colorful
MarkupStart=<div class="colorful">
MarkupEnd=<!-- end of colorful --></div>
```

These values are used in `StyleName`, `MarkupStart`, and `MarkupEnd` in the `KVStyle` structure. See [KVStyle](#), on page 197.

3. For each style, define the flag that applies. Flags define instructions on how to process the content associated with a paragraph or character style. They are defined in `kvtypes.h` and described in [Flags for Defining Styles, on the next page](#). This value is used in `dwflags` of the `KVStyle` structure. See [KVStyle](#), on page 197. The value associated with each flag is a hexadecimal number. You can set an option by either entering the converted decimal value or entering the flag's text.

```
Flags=0
```

A finished entry in a template file could look like this:

```
[KVStyle]
NumStyles=3

[Style1]
StyleName=Colorful
MarkupStart=<div class="Colorful">
MarkupEnd=<!-- End of Colorful --></div>
Flags=0

[Style2]
StyleName=RedactPara
MarkupStart=<div class="RedactPara">
MarkupEnd=<!-- End of RedactPara --></div>
Flags=2048

[Style3]
StyleName=Code
MarkupStart=<pre>
MarkupEnd=<!-- End of Code --></pre>
Flags=KVSTYLE_PRE
```

Use the COM interface

To map styles by using the COM interface

1. Call the `AddStyleMapping()`, `GetStyleMapping()`, and `RemoveStyleMapping()` methods. See [AddStyleMapping, on page 247](#), [GetStyleMapping, on page 248](#), and [RemoveStyleMapping, on page 250](#).
2. Define the `NumStyles` property. See [NumStyles, on page 262](#).

Flags for Defining Styles

Flag	Description
KVSTYLE_PRE	The KVSTYLE_PRE flag specifies that white space should be preserved (treated as characters, not word separators), and that mode changes, such as changes in font size within a paragraph, should be ignored. This allows the tags <code><pre></code> and <code></pre></code> to be used.
KVSTYLE_HEADING[1-6]	<p>The flags KVSTYLE_HEADING[1-6] specify that a given style is to be detected and processed as a heading. Heading flags are exclusive. This means a style cannot be processed as both h1 and h2.</p> <p>By default, Export maps the heading style "Heading 1" to <code><h1></h1></code>, and so on, for heading levels 1 through 6. If you use style mappings, the default mapping is overridden. Therefore, you must supply markup for <i>all</i> heading levels. Export uses heading levels to define the overall structure of the HTML output.</p>
KVSTYLE_ORDERLIST	The KVSTYLE_ORDERLIST flag specifies that the style should be tagged as an ordered list. Currently not implemented.
KVSTYLE_UNORDEREDLIST	The KVSTYLE_UNORDEREDLIST flag specifies that the style should be tagged as an unordered list. Currently not implemented.
KVSTYLE_DELETECONTENT	The KVSTYLE_DELETECONTENT flag specifies that the content associated with the style tag should be deleted from the output.
KVSTYLE_ONCONSECUTIVEPARAGRAPHS	The KVSTYLE_ONCONSECUTIVEPARAGRAPHS flag specifies that the style should be applied to consecutive paragraphs of the document. If this flag is used, and two or more paragraphs require the same style, the opening and closing tags that normally appear between each paragraph are not generated.
KVSTYLE_REDACT	The KVSTYLE_REDACT flag is used to hide sensitive or confidential information in the source document. It specifies that the text associated with the style tag should be replaced in the HTML output with a selected character. The default replacement character is "X," but you can specify a different replacement character by setting <code>cRedact</code> . See Redact, on page 215 .

Use Style Sheets

You can use style sheets to define the overall layout and type specifications of the HTML output. Export can write style sheet information to an external Cascading Style Sheet (CSS) file, or read the information from an existing CSS file during the conversion. The formatting data can either be stored within the output HTML file (inline), or externally in a CSS file. Using an external style sheet makes the HTML output significantly smaller, and allows you to use the same style sheet for many conversions. The style sheet options are enumerated in `KVHTMLStyleSheetType`.

NOTE: Cascading style sheets can be used only with word processing documents.

To enable CSS formatting and output the generated formatting data within the output HTML stream, set `eStyleSheetType` member to `CSS_INLINE`, either directly in the `KVHTMLOptionsEx` structure or in the template file.

To enable CSS formatting and output the generated formatting data in an external CSS file that is referenced in the HTML output as a tag

1. Set `eStyleSheetType` to `CSS_TOFILE`, either directly in the `KVHTMLOptionsEx` structure or in the template file.
2. In the template file, use the `$STYLESHEET` token to specify the URL of the style sheet in the HTML output. The external CSS file is referenced in the output HTML by a `LINK` statement of the form:

```
<LINK rel="STYLESHEET" href="CSS_file" type="text/css">
```

3. Call the `KVHTMLSetStyleSheet()` function to set the path and file name of the external style sheet. See [KVHTMLSetStyleSheet\(\), on page 182](#).

The sample program `htmlini` provides an example of using style sheets. [htmlini, on page 118](#).

Display Vector Graphics on UNIX and Linux

Export offers the option of rasterizing vector graphic content from source documents into a variety of graphics formats including JPEG, PNG, WMF, and CGM. This solution is implemented with Windows Graphical Device Interface (GDI) code, and therefore is not portable to other platforms.

The output format of vector graphics is defined by the `OutputVectorGraphicType` member in the `KVHTMLOptionsEx` structure, and the options are enumerated in `KVHTMLGraphicType` in `kvhtml.h`. See [KVHTMLOptionsEx, on page 208](#) and [KVHTMLGraphicType, on page 235](#).

To display vector graphics in presentation, word processing, and spreadsheet files on UNIX and Linux, Export converts the files directly to JPEG by using a Java program named `kvraster.class`. This program uses the Java Abstract Windowing Toolkit (AWT). The AWT requires access to an X Server.

NOTE: If you are using KeyView 10.5.0.0 or Java 1.6, you do not have to set up an X Server; however, if you are using a version of KeyView lower than 10.4 with a version of Java lower than 1.6, you must set up an X Server.

To set up an X Server, do one of the following:

- Run a virtual X Server, such as the Xvfb utility. This utility is included in the X11R6 distribution, or you can download it from the following site:

<http://www.x.org/Downloads.html>

For example, to run the Xvfb utility on a 512 Mb, Solaris 2.8 platform, follow these steps:

1. Start Xvfb at root:

```
/usr/X11R6/bin/Xvfb :1 -screen 0 1152x900x8 &
```

2. Set the display environment variable:

```
setenv DISPLAY:1.0
```

- Make an X display available to the Java runtime by using the `DISPLAY` environment variable. No windows appear on the display. For example, set the `DISPLAY` environment variable as follows:

```
setenv DISPLAY computername:0.0
```

or

```
setenv DISPLAY ipaddress:0.0
```

After the X Server is set up, convert the file by following these steps:

1. Add the location of the JRE to the `PATH` environment variable.
2. Set `OutputVectorGraphicType` to `KVGFX_JPEG` in the `defunix.ini` template file or directly in the API.
3. Convert the document to HTML. The graphics in the document are converted to JPEG and stored in the output directory.

NOTE:

`kvvector.jar` must reside in the output directory.

Search and Highlight Terms

KeyView can use the highlighting API to find and highlight specified text strings in the HTML output. Only text strings that exactly match the search term are highlighted. For example, if the term "house" is specified, the string "house" would be highlighted in **house**, **houses**, and **housed**, but would not be highlighted in the term "housing." You can define the text attributes used to highlight the text, such as bold, red, or underlined, and the text's target character set.

If a specified term contains HTML code, it is not found. For example, if the phrase "weekly schedule" was specified, the following string in the output HTML would not be found:

```
weekly <b>schedule</b>
```

If you specify multiple terms, and some terms are subsets of other terms, Micro Focus recommends that you specify the superset first. For example,

```
["North American car manufacturers" "car manufacturers" "car"]
```

To specify search terms by using the C API

1. Define the `KVHTMLHighlight` data structure specifying the list of terms, the highlighting attributes, and the case-sensitivity Boolean. See [KVHTMLHighlight](#), on page 203.
2. Call the `fpSetHighlight()` function. See [KVHTMLSetHighlight\(\)](#), on page 181.

Include Revision Information

The revision tracking feature in applications—such as Microsoft Word's **Track Changes**—marks changes to a document (typically, strikethrough for deleted text and underline for inserted text) and tracks each change by reviewer name and date.

If revision tracking was enabled when changes were made to a document, You can configure Export to convert the deleted text and graphics and include revision information in the HTML output. (The deleted content and revision information is excluded from the HTML output by default.)

Content that was added to the document is identified by `<ins>` tags and is underlined when displayed in a browser. Content that was deleted from the document is identified by `` tags and is displayed with strikethrough formatting. The `<ins>` and `` tags include the following attributes:

<code>style</code>	This is an optional attribute that is not included by default. You can define a unique HTML style (such as <code>color: red; background: orange</code>) that is applied to each reviewer's edits. See Configure the Revision Style , on page 88.
<code>title</code>	<p>The <code>title</code> attribute can contain a prefix and revision information which is displayed in a browser. By default, the prefix is either the text string "inserted:" or "deleted:", and the revision information includes the reviewer name, and the date and time the revision was made.</p> <p>You can exclude the <code>title</code> attribute or define different text strings for the <code>title</code> attribute (see Configure the Revision Title, on the next page).</p>
<code>cite</code>	The <code>cite</code> attribute contains the name of the reviewer who made the revision.
<code>datetime</code>	The <code>datetime</code> attribute contains the date and time the revision was made. The date is in ISO-8601 format: <code>YYYY-MM-DDThh:mm:ss</code> .

For example, the following markup can be generated for inserted text:

```
<ins style="color: red" title="Inserted: JohnD, 2006-04-24T14:47:00"
cite="mailto:JohnD" datetime="2006-04-24T14:47:00">This text was added</ins> in a
previous version.
```

This text is displayed in the browser as:

This text was added in a previous version.

When you hover the cursor over the underlined text in the browser, the text "**Inserted: JohnD, 2006-04-24T14:47:00**" is displayed as a ToolTip.

NOTE: Whether the text is displayed with strikethrough or underline depends on the configuration and capabilities of the browser.

To convert deleted text and graphics and include revision information

1. Call the `fpInit()` function. See [fpInit\(\)](#), on page 167.
2. Define the `KVRevisionMark` structure. See [KVRevisionMark](#), on page 223.
3. Call the `fpHTMLConfig()` function with the following arguments (see [KVHTMLConfig\(\)](#), on page 170):

Argument	Parameter
----------	-----------

<code>nType</code>	<code>KVCFG_INCLREVISIONMARK</code>
<code>nValue</code>	<code>TRUE</code>
<code>pData</code>	A pointer to the <code>KVRevisionMark</code> structure which defines the information that appears in the <code>title</code> attribute and the HTML styles applied to revised content. If you pass <code>NULL</code> to this function, defaults are used.

For example:

```
KVRevisionMark    RMark;
memset(&RMark, 0, sizeof(KVRevisionMark));
KVStructInit(&RMark);
RMark...
(*fpHTMLConfig)(pKVHTML, KVCFG_INCLREVISIONMARK, TRUE, &RMark))
```

The `htmlini` sample program demonstrates this function. See [htmlini](#), on page 118.

4. Call the `fpConvertStream()` or `KVHTMLConvertFile()` function. See [fpConvertStream\(\)](#), on page 156 or [KVHTMLConvertFile\(\)](#), on page 177.

Configure the Revision Title

The `title` attribute can contain a prefix and revision information which is displayed in a browser. By default, the prefix is either the text string "inserted:" or "deleted:" and the reviewer name and date/time are included in the title.

- To exclude the `title` attribute from the `<ins>` and `` tags, set the `RM_TITLE_FLAG` in the `KV_RM_Title` structure to `RMT_off`. See [KV_RM_Title](#), on page 224.
- To define a different text string for the prefix, specify a new text string in the `pPrefix` member and set the `nSize` and `eCharSet` members of the `KV_RM_Title` structure. See [KV_RM_Title](#), on page 224.
- To change the revision information included in the `title` attribute, set the `RM_TITLE_FLAG` in the `KV_RM_Title` structure. See [RM_Title_Flag](#), on page 244.

The following example sets the prefix as "Added:" and "Removed:" for inserted and deleted text respectively, and only includes the reviewer name in the `title` attribute:

```
KVRevisionMark    RMark;
char              RMInsPre[16] = "Added:";
char              RMDelPre[16] = "Removed:";
memset(&RMark, 0, sizeof(KVRevisionMark));
KVStructInit(&RMark);
RMark.InsTitle.eFlag = RMT_Author;
```

```
RMark.InsTitle.pPrefix = (BYTE *)&RMInsPre);
RMark.InsTitle.nSize = strlen(RMInsPre);
RMark.InsTitle.eCharSet = KVCS_UTF8;
RMark.DelTitle.eFlag = RMT_Author;
RMark.DelTitle.pPrefix = (BYTE *)&RMDelPre);
RMark.DelTitle.nSize = strlen(RMDelPre);
RMark.DelTitle.eCharSet = KVCS_UTF8;
(*fpHTMLConfig)(pKVHTML, KVCFG_INCLREVISIONMARK, TRUE, &RMark))
```

Configure the Revision Style

You can define a unique HTML style (such as `color: red; background: orange`) that is applied to each reviewer's modifications. This allows you to easily differentiate between multiple reviewers' edits. For example, changes made by JSmith are highlighted in red, changes made by RBrown are highlighted in blue, and so on.

To define revision styles, set the number of revision styles in the `nAuthorStyles` member of the `KVRevisionMark` structure, and use the `ppAuthorStyles` member for each style to define the contents of the `style` attribute. See [KVRevisionMark](#), on page 223.

The following example defines two revision styles:

```
KVRevisionMark    RMark;
char    RMAuthorStyle0[60] = "color: red; background: yellow";
char    RMAuthorStyle1[60] = "color: green; background: silver";
    memset(&RMark, 0, sizeof(KVRevisionMark));
    KVStructInit(&RMark);
    RMark.nAuthorStyles = 2;
    RMark.ppAuthorStyles = (char **)malloc(sizeof(char *)*2);
    if(!RMark.ppAuthorStyles) return(1);
    RMark.ppAuthorStyles[0] = RMAuthorStyle0;
    RMark.ppAuthorStyles[1] = RMAuthorStyle1;
(*fpHTMLConfig)(pKVHTML, KVCFG_INCLREVISIONMARK, TRUE, &RMark))
```

If there are more reviewers than defined styles, KeyView applies all available styles to the reviewers in the order in which they are encountered in the document, and then applies styles starting from the beginning of the list to the remaining reviewers. This process is repeated until all reviewers' edits are highlighted.

NOTE: KeyView does not validate styles. They are written directly to the HTML output.

Generate a Revision Summary

You can configure Export to summarize the changes made to a document in a revision summary file that is generated during the HTML conversion. The summary file is created in the directory where the HTML output is generated. The default file name is `output_filename.revsum.htm`. You can customize this file name by using the `fpGetAnchor` callback function. See [GetAnchor\(\)](#), on page 188.

To create a revision summary file, set the `bCreateSummary` flag to `TRUE` in the `KVRevisionMark` structure, and use the `pszRevSumStartBlock` and `pszRevSumEndBlock` members to define the markup and tokens inserted at the beginning and end of the revision summary file.

For example:

```
KVRevisionMark    RMark;
char              RMStartBlock[500] = "<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML
4.0//EN"> <html> <body>";
char              RMEndBlock[30] = "</body> </html>";
    memset(&RMark, 0, sizeof(KVRevisionMark));
    KVStructInit(&RMark);
    RMark.pszRevSumStartBlock = RMStartBlock;
    RMark.pszRevSumEndBlock = RMEndBlock;
    RMark.bCreateSummary = TRUE;
(*fpHTMLConfig)(pKVHTML, KVCFG_INCLREVISIONMARK, TRUE, &RMark))
```

Extract Text from Text Boxes

By default, the contents of Microsoft Word text boxes are converted to graphics and exported. Alternatively, you can convert the contents of text boxes to text. Note, the extracted text box text is not formatted.

To enable text box extraction

- Add the following to the `formats_e.ini` file:

```
[WordTextBoxOptions]
OutputText=true
```

Convert PDF Files

Export has special configuration options that allow greater control over the conversion of PDF files. These options can improve the fidelity and accuracy of the HTML output.

Use the pdf2sr Reader

In KeyView Export SDK 10.24, the `pdf2sr` reader was added. It generates a high fidelity raster image of each page in the PDF and will insert text that has a zero opacity value in the HTML to allow for text searching in a web browser.

The `pdf2sr` reader has the following features:

- supports standard and custom metadata (non-XMP)
- supports basic text extraction
- supports password protected PDFs

The `pdf2sr` reader has the following limitations:

- does not support logical order
- does not support bidi PDFs
- does not extract subfiles
- does not extract bookmarks from PDFs
- does not give estimations on percent embedded fonts match with display glyphs
- Does not support XMP metadata
- Does not support headers or footers
- does not support annotations
- does not support content access stream
- does not support tagged content (PDFs)

To specify the pdf2sr reader

1. Open the `formats_e.ini` file with a text editor.
2. In the `[Formats]` section, set the following parameter to the pdf2sr reader:

`200=pdf2`

When you use the pdf2sr reader, the output HTML uses HTML5 syntax that might be disabled when using Internet Explorer to view the output. It might prompt the user for permission to run. To disable this behavior, configure Internet Explorer as follows:

1. In Internet Explorer, select **Tools** from the menu.
2. Select **Internet Options**.
3. Click the **Advanced** tab.
4. In the **Security** area, click **Allow active content to run in files on My Computer**.

Use a Graphic-based Reader

Two graphic-based PDF readers are available. The readers display PDFs by converting each page of the PDF to an image. If you do not want to redistribute the Acrobat Reader with your application, you can use a graphic-based reader instead.

The two readers support different features. Choose the appropriate reader depending on your requirements:

- The kppdfdr reader supports highlighting, annotation, and several other features but also has several graphical limitations.
- The kppdf2rdr reader produces high-fidelity raster images but is a viewer only and does not support highlighting or other features.

Use the kppdfdr Reader

The kppdfdr graphic-based reader has the following features:

- supports vector images
- supports rotation and scaling

- supports multibyte and bidirectional text
- allows you to search text in the output

The kppdfldr reader has the following limitations:

- Embedded fonts in a PDF file are not translated correctly. They are usually displayed using the question mark (?) replacement character.
- If an unsupported font is encountered during conversion, the default font, Times New Roman, is substituted.
- Supports 180 degree rotation only for raster images.
- Supports the following color spaces: DeviceRGB, DeviceGray, DeviceCMYK, CalGray, and CalRGB color spaces. Indexed color spaces are supported as long as they are used with a supported basic color space.
- Does not support hyperlinks.
- Does not extract summary information (metadata).

Use the kppdf2rdr Reader

The kppdf2rdr graphic-based reader produces high-fidelity raster images. However, it has the following limitations:

- Does not support anything beyond viewing, such as text searching.
- Does not support PDFs that contain XFA forms content.

Specify the Graphic-based Reader

By default, the Acrobat control is used to convert PDF documents. Use the following procedure to specify that one of the graphic-based readers be used to convert PDF documents.

To specify the graphic-based reader

1. Open the `formats_e.ini` file with a text editor. The file is installed in the root of the Windows directory.
2. In the `[HiFi]` section, set the following parameter to the graphic-based reader you want to use. Set one of the following values:
 - For the kppdfldr reader:
`200=kppdfldr.dll`
This is the default setting.
 - For the kppdf2rdr reader:
`200=kppdf2rdr.dll`
Set `CFG_SETHIFIPDF` field in the `HtmlExport` class.
3. Set the `KVCFG_SETHIFIPDF` option in the `fpHTMLConfig()` function (see [KVHTMLConfig\(\)](#), on [page 170](#)).

Convert PDF Files to Raster Images

Export allows you to convert each page of a PDF document to a raster image, providing a high-fidelity conversion of the document.

The output format depends on the value of `OutputRasterGraphicType` in `KVHTMLOptionsEx`. See [KVHTMLOptionsEx](#), on page 208.

On UNIX and Linux, the conversion of PDFs to JPEG uses the Java program `kvraster.class`. This Java program requires some setup. See [Display Vector Graphics on UNIX and Linux](#), on page 84.

To use a graphic-based reader to convert PDF documents

1. Specify the graphic-based reader that you want to use.
2. Call the `fpInit()` function. See [fpInit\(\)](#), on page 167.
3. Call the `KVHTMLConfig()` function with the following arguments (see [KVHTMLConfig\(\)](#), on page 170):

Argument	Parameter
<code>nType</code>	<code>KVCFG_SETHIFIPDF</code>
<code>nValue</code>	<code>TRUE</code> (non-zero)
<code>pData</code>	<code>NULL</code>

For example:

```
(*fpHTMLConfig)(pKVHTML, KVCFG_SETHIFIPDF, TRUE, NULL);
```

The `cnv2html` sample program demonstrates this function. See [cnv2html](#), on page 115.

4. Call the `fpConvertStream()` or `KVHTMLConvertFile()` function. See [fpConvertStream\(\)](#), on page 156 or [KVHTMLConvertFile\(\)](#), on page 177.

Convert PDF Files to a Logical Reading Order

The PDF format is primarily designed for presentation and printing of brochures, magazines, forms, reports, and other materials with complex visual designs. Most PDF files do not contain the *logical structure* of the original document—the correct reading order, for example, and the presence and meaning of significant elements such as headers, footers, columns, tables, and so on.

KeyView can convert a PDF file either by using the file's internal unstructured paragraph flow, or by applying a structure to the paragraphs to reproduce the logical reading order of the visual page. Logical reading order enables KeyView to produce PDF files containing languages that read from right-to-left (such as Hebrew and Arabic) in the correct reading direction.

NOTE: The algorithm used to reproduce the reading order of a PDF page is based on common page layouts. The paragraph flow generated for PDFs with unique or complex page designs might not emulate the original reading order exactly.

For example, page design elements such as drop caps, callouts that cross column boundaries, and significant changes in font size might disrupt the logical flow of the output text.

Logical Reading Order and Paragraph Direction

By default, KeyView produces an *unstructured* text stream for PDF files. This means that PDF paragraphs are extracted in the order in which they are stored in the file, not the order in which they appear on the visual page. For example, a three-column article could be output with the headers and the title at the end of the output file, and the second column extracted before the first column. Although this output does not represent a logical reading order, it accurately reflects the internal structure of the PDF.

You can configure KeyView to produce a *structured* text stream that flows in a specified direction. This means that PDF paragraphs are extracted in the order (logical reading order) and direction (left-to-right or right-to-left) in which they appear on the page.

The following paragraph direction options are available.

Paragraph Direction Option	Description
Left-to-right	Paragraphs flow logically and read from left to right. You should specify this option when most of your documents are in a language that uses a left-to-right reading order, such as English or German.
Right-to-left	Paragraphs flow logically and read from right to left. You should specify this option when most of your documents are in a language that uses a right-to-left reading order, such as Hebrew or Arabic.
Dynamic	Paragraphs flow logically. The PDF reader determines the paragraph direction for each PDF page, and then sets the direction accordingly. When a paragraph direction is not specified, this option is used.

NOTE: Conversions might be slower when logical reading order is enabled. For optimal speed, use an unstructured paragraph flow.

The paragraph direction options control the direction of paragraphs on a page; they do not control the text direction in a paragraph. For example, let us say that a PDF file contains English paragraphs in three columns that read from left to right, but 80% of the second paragraph contains Hebrew characters. If the left-to-right logical reading order is enabled, the paragraphs are ordered logically in the output—title paragraph, then paragraph 1, 2, 3, and so on—and flow from the top left of the first column to the bottom right of the third column. However, the *text* direction of the second paragraph is determined independently of the page by the PDF reader, and is output from right to left.

NOTE: Note: Extraction of metadata is not affected by the paragraph direction setting. The characters and words in metadata fields are extracted in the correct reading direction regardless of whether logical reading order is enabled.

Enable Logical Reading Order

You can enable logical reading order by using either the API or the `formats_e.ini` file. Setting the direction in the API overrides the setting in the `formats_e.ini` file.

Use the C API

To enable PDF logical reading order in the C API

1. Call the `fpInit()` function. See [fpInit\(\)](#), on page 167.
2. Call the `KVHTMLConfig()` function with the following arguments (see [KVHTMLConfig\(\)](#), on page 170):

Argument	Parameter
nType	KVCFG_LOGICALPDF
nValue	Set to one of the following flags which are defined in <code>kvtypes.h</code> . (see LPDF_DIRECTION , on page 243): <ul style="list-style-type: none">• LPDF_LTR—Logical reading order and left-to-right paragraph direction.• LPDF_RTL—Logical reading order and right-to-left paragraph direction.• LPDF_AUTO—Logical reading order. The PDF reader determines the paragraph direction for each PDF page, and then sets the direction accordingly. When a paragraph direction is not specified, this option is used.• LPDF_RAW—Unstructured paragraph flow. This is the default behavior. If logical reading order is enabled, and you want to return to an unstructured paragraph flow, set this flag.
pData	NULL

For example:

```
(*fpHTMLConfig)(pKVHTML, KVCFG_LOGICALPDF, LPDF_RTL, NULL);
```

The `cnv2html` sample program demonstrates this function. See [cnv2html](#), on page 115.

3. Call the `fpConvertStream()` or `KVHTMLConvertFile()` function. See [fpConvertStream\(\)](#), on page 156 or [KVHTMLConvertFile\(\)](#), on page 177.

Use the `formats_e.ini` File

The `formats_e.ini` file is in the directory `install\OS\bin`, where `install` is the path name of the Export installation directory and `OS` is the name of the operating system.

To enable logical reading order by using the `formats_e.ini` file

1. Change the PDF reader entry in the `[Formats]` section of the `formats_e.ini` file as follows:

```
[Formats]  
200=1pdf
```

2. Optionally, add the following section to the end of the `formats_e.ini` file:

```
[pdf_flags]
pdf_direction=paragraph_direction
```

where *paragraph_direction* is one of the following:

Flag	Description
------	-------------

LPDF_ LTR	Left-to-right paragraph direction
-----------	-----------------------------------

LPDF_ RTL	Right-to-left paragraph direction
-----------	-----------------------------------

LPDF_ AUTO	The PDF reader determines the paragraph direction for each PDF page, and then sets the direction accordingly. When a paragraph direction is not specified, this option is used.
------------	---

LPDF_ RAW	Unstructured paragraph flow. This is the default behavior. If logical reading order is enabled, and you want to return to an unstructured paragraph flow, set this flag.
-----------	--

Generate a Table of Contents from PDF Bookmarks

When you convert PDF files to HTML by using the basic reader (`pdfsr`), the table of contents is generated from "bookmarks" within the PDF file. The hyperlinked table of contents can appear either at the beginning of the HTML file or in a separate frame.

Micro Focus recommends that you configure the conversion so that the table of contents appears in a separate frame (the template `pdfframe.ini` demonstrates how to do this). Export uses absolute positioning when converting a PDF file, that is, the text appears in the exact position as in the original document. Table of contents entries do not contain absolute positioning information. Therefore, if the main document and the table of contents are generated in the same output file, the table of contents entries might overlap the body text in the document.

NOTE: When PDF bookmarks are converted to a table of contents in HTML, the generated links do not lead to the exact location of the destination marker, but jump to the page on which the destination marker exists. This is similar to the behavior of the Adobe Acrobat Reader.

Disable Bookmark Conversion

By default, Export converts PDF bookmarks to a table of contents in the HTML output. However, you can configure Export not to generate a table of contents based on the PDF bookmarks.

To prevent conversion of PDF bookmarks

1. Call the `fpInit()` function. See [fpInit\(\)](#), on page 167.
2. Call the `KVHTMLConfig()` function with the following arguments (see [KVHTMLConfig\(\)](#), on page 170):

Argument	Parameter
----------	-----------

nType	KVCFG_SUPPRESSTOCPRINTIMAGE
-------	-----------------------------

nValue	TRUE (non-zero)
--------	-----------------

pData	NULL
-------	------

For example:

```
(*fpHTMLConfig)(pKVHTML, KVCFG_SUPPRESSTOCPRINTIMAGE, TRUE, NULL);
```

The sample programs `Export Demo` and `cnv2html` have `KVCFG_SUPPRESSTOCPRINTIMAGE` enabled. When you use these programs to convert a PDF file with bookmarks, the HTML output does not include a table of contents.

3. Call the `fpConvertStream()` or `KVHTMLConvertFile()` function. See [fpConvertStream\(\), on page 156](#) or [KVHTMLConvertFile\(\), on page 177](#).

Convert Invisible Text

PDF documents sometimes contain invisible text. You can search this text in Adobe PDF Reader, but you cannot view it in a web browser.

Toggle Invisible Text

You can add a JavaScript button to the upper right corner of the exported page, which you can click to toggle between invisible and regular text. When you turn on invisible text, the invisible text is displayed and the regular content is hidden; when you turn off invisible text, the invisible text is hidden.

Invisible text is hidden by default. The toggle button only appears if invisible text is detected in the PDF document.

To add an invisible text toggle button

1. Call the `fpInit()` function. See [fpInit\(\), on page 167](#).
2. Call the `KVHTMLConfig()` function with the following arguments (see [KVHTMLConfig\(\), on page 170](#)):

Argument	Parameter
----------	-----------

nType	KVCFG_SETPDFINVISIBLETEXTTOGGLE
-------	---------------------------------

nValue	0 (not used)
--------	--------------

pData	szButtonName
-------	--------------

For example:

```
(*fpHTMLConfig)(pKVHTML, KVCFG_SETPDFINVISIBLETEXTTOGGLE, 0, szButtonName);
```

The `cnv2html` and `htmlini` sample programs demonstrate this function. See [cnv2html, on page 115](#) and [htmlini, on page 118](#).

3. Call the `fpConvertStream()` or `KVHTMLConvertFile()` function. See [fpConvertStream\(\), on page 156](#) or [KVHTMLConvertFile\(\), on page 177](#).

NOTE: If no invisible text is detected in the PDF document, no toggle button appears in the HTML output even if you set `KVCFG_SETPDFINVISIBLETEXTTOGGLE`.

Specify Opacity of Invisible Text

Invisible text often occurs in PDF documents when the PDF software processes rasterized images through optical character recognition and then inserts the text in the PDF. You might want to display both the invisible text as well as the rasterized image. To do so, you can set the invisible text *opacity* as determined by an integer from 0 to 100, where 0 hides the invisible text and 100 displays it fully.

Invisible text opacity is set to 0 by default.

To set invisible text opacity

1. Call the `fpInit()` function. See [fpInit\(\), on page 167](#).
2. Call the `KVHTMLConfig()` function with the following arguments (see [KVHTMLConfig\(\), on page 170](#)):

Argument	Parameter
----------	-----------

<code>nType</code>	<code>KVCFG_SETPDFINVISIBLETEXTOPACITY</code>
--------------------	---

<code>nValue</code>	<code>iInvisOpacity</code>
---------------------	----------------------------

<code>pData</code>	<code>NULL</code>
--------------------	-------------------

For example:

```
(*fpHTMLConfig)(pKVHTML, KVCFG_SETPDFINVISIBLETEXTOPACITY, iInvisOpacity, NULL);
```

The `htmlini` sample program demonstrates this function. See [htmlini, on page 118](#).

3. Call the `fpConvertStream()` or `KVHTMLConvertFile()` function. See [fpConvertStream\(\), on page 156](#) or [KVHTMLConvertFile\(\), on page 177](#).

Convert Rotated Text

By default, rotated text is displayed in its original position, at the original font size, and at 0 degrees rotation in the HTML output. The text is not rotated in the HTML output because text rotation is not supported by HTML.

Because the text is the original size, but might be displayed in a smaller space (at 0 degrees), the text might overlap adjacent text in the HTML output. To avoid this problem, you can specify that the rotated text be removed from its original position and displayed at the bottom of the HTML page on which it appears.

To specify that rotated text be displayed at the bottom of the HTML page

1. Call the `fpInit()` function. See [fpInit\(\), on page 167](#).
2. Call the `KVHTMLConfig()` function with the following arguments (see [KVHTMLConfig\(\), on page 170](#)):

Argument	Parameter
nType	KVCFG_SETTEXTROTATE
nValue	TRUE (non-zero)
pData	NULL

For example:

```
(*fpHTMLConfig)(pKVHTML, KVCFG_SETTEXTROTATE, TRUE, NULL);
```

The sample programs `Export Demo` and `cnv2html` demonstrate how to use this function. See [Use the Export Demo Program, on page 40](#), and [htmlini, on page 118](#).

Call the `fpConvertStream()` or `KVHTMLConvertFile()` function. See [fpConvertStream\(\), on page 156](#) or [KVHTMLConvertFile\(\), on page 177](#).

NOTE: When this feature is enabled, white space is added to the bottom of every HTML page to accommodate any rotated text.

Control Hyphenation

There are two types of hyphens in a PDF document:

- A *soft hyphen* is added to a word by a word processor to divide the word across two lines. This is a discretionary hyphen and is used to ensure proper text flow in justified text.
- A *hard hyphen* is intentionally added to a word regardless of the word's position in the text flow. It is required by the rules of grammar or word usage. For example, compound words, such as "three-week vacation" and "self-confident" contain hard hyphens.

By default, KeyView maintains the source document's soft hyphens in the output HTML to more accurately represent the source document's layout. However, if you are using Export to generate text output for an indexing engine or are not concerned with maintaining the document's layout, Micro Focus recommends that you remove soft hyphens from the HTML output. To remove soft hyphens, you must enable the soft hyphen flag.

NOTE: If the soft hyphen flag is enabled, every hyphen at the end of a line is considered a soft hyphen and removed from the HTML output. If a hard hyphen appears at the end of a line, it is also removed. This might result in an intentionally hyphenated word being extracted without a hyphen.

To remove soft hyphens from the HTML output

1. Call the `fpInit()` function. See [fpInit\(\), on page 167](#).
2. Call the `KVHTMLConfig()` function with the following arguments (see [KVHTMLConfig\(\), on page 170](#)):

Argument	Parameter
nType	KVCFG_DELSOFTYPHEN
nValue	TRUE (non-zero)

Argument	Parameter
----------	-----------

pData	NULL
-------	------

For example:

```
(*fpHTMLConfig)(pKVHTML, KVCFG_DELSOFTHYPHEN, TRUE, NULL);
```

3. Call the `fpConvertStream()` or `KVHTMLConvertFile()` function. See [fpConvertStream\(\), on page 156](#) or [KVHTMLConvertFile\(\), on page 177](#).

Extract Custom Metadata from PDF Files

To extract custom metadata from your PDF files, add the custom metadata names to the `pdfsr.ini` file provided, and copy the modified file to the `\bin` directory. You can then extract metadata as you normally would.

The `pdfsr.ini` is in the directory `samples\pdfini`, and has the following structure:

```
<META>
<TOTAL>total_item_number</TOTAL>,
/metadata_tag_name datatype,
</META>
```

Parameter	Description
total item number	The total number of metadata tags that are listed.
metadata_tag_name	The metadata tag name used in the PDF files.
datatype	The data type of the metadata field. Data types are defined in <code>KVSumInfoType</code> . See KVSumInfoType, on page 239 .

For example:

```
<META>
<TOTAL> 4 </TOTAL>
/part_number      INT4
/volume           INT4
/purchase_date    DATETIME
/customer         STRING
</META>
```

NOTE: Metadata cannot be extracted from PDFs when the PDF is converted to JPEG. See [Convert PDF Files to Raster Images, on page 92](#).

Convert Spreadsheet Files

Export has special configuration options that allow greater control over the conversion of spreadsheet files.

Convert Hidden Text in Microsoft Excel Files

Normally, Export does not convert hidden text from a Microsoft Excel spreadsheet because it is assumed that the text should not be exposed. You can change this default behavior and convert text in hidden rows, columns, and sheets by adding the following lines to the `formats_e.ini` file:

```
[Options]
gethiddeninfo=1
```

Convert Headers and Footers in Microsoft Excel 2003 Files

Normally, Export does not convert headers and footers from Microsoft Excel 2003 spreadsheets. You can change this default behavior and convert headers and footers by adding the following lines to the `formats_e.ini` file:

```
[Options]
ShowHeaderFooter=1
```

Specify Date and Time Format on UNIX Systems

In Microsoft Excel you can choose to format dates and times according to the system locale. On Windows, KeyView uses the system locale settings to determine how these dates and times should be formatted. In other operating systems, KeyView uses the U.S. short date format (*mm/dd/yyyy*). You can change this by specifying the formats you wish to use in the `formats.ini` file.

To specify the system date and time format on UNIX systems

- In the `formats.ini` file, specify the following options:
 - `SysDateTime`. The format to use when a cell is formatted using the system format including both the date and the time.
 - `SysLongDate`. The format to use when a cell is formatted using the system long date format.
 - `SysShortDate`. The format to use when a cell is formatted using the system short date format.
 - `SysTime`. The format to use when a cell is formatted using the system time format.

NOTE:

These values cannot contain spaces.

For example, if you specify `SysDateTime=%d/%m/%Y`, dates and times are extracted in the following format:

`28/02/2008`

The format arguments are the same as those for the `strftime()` function.

See <http://linux.die.net/man/3/strftime> for more information.

Convert Very Large Numbers in Spreadsheet Cells to Precision Numbers

Numbers in Microsoft Excel files can now be exported and written to the output without formatting. By default, numbers are exported in the format specified by the Excel file (for example, *General*, *Currency*, and *Date*). Spreadsheets might contain cells that have very large numbers in them. Excel displays the numbers in a scientific notation that rounds or truncates the numbers.

To export numbers without formatting, add the following options in the following lines to the `formats_e.ini` file:

```
[Options]
ignoredefnumformats=1
```

Extract Microsoft Excel Formulas

Normally, the actual value of a formula is extracted from an Excel spreadsheet; the formula from which the value is derived is not included in the output. However, KeyView enables you to include the value as well as the formula in the output. For example, if Export is configured to extract the formula and the formula value, the output might look like this:

```
245 = SUM(B21:B26)
```

The calculated value from the cell is 245, and the formula from which the value is derived is `SUM(B21:B26)`.

NOTE: Depending on the complexity of the formulas, enabling formula extraction might result in slightly slower performance.

To set the extraction option for formulas, add the following lines to the `formats_e.ini` file:

```
[Options]
getformulastring=option
```

where *option* is one of the following:

Option	Description
0	Extract the formula value only. This is the default. If formula extraction is enabled, and you want to return to the default, set this option.
1	Extract the formula only.
2	Extract the formula and the formula value.

NOTE: If a function in a formula is not supported or is invalid, and option 1 or 2 is specified, only the calculated value is extracted. See [Supported Microsoft Excel Functions, on the next page](#) for a list of supported functions.

When formula extraction is enabled, Export can extract Microsoft Excel formulas containing the functions listed in [Supported Microsoft Excel Functions](#), below:

Supported Microsoft Excel Functions

=ABS()	=ACOS()	=AND()	=AREAS()
=ASIN()	=ATAN2()	=ATAN2()	=AVERAGE()
=CELL()	=CHAR()	=CHOOSE()	=CLEAN()
=CODE()	=COLUMN()	=COLUMNS()	=CONCATENATE()
=COS()	=COUNT()	=COUNTA()	=DATE()
=DATEVALUE()	=DAVERAGE()	=DAY()	=DCOUNT()
=DDB()	=DMAX()	=DMIN()	=DOLLAR()
=DSTDEV()	=DSUM()	=DVAR()	=EXACT()
=EXP()	=FACT()	=FALSE()	=FIND()
=FIXED()	=FV()	=GROWTH()	=HLOOKUP()
=HOUR()	=ISBLANK()	=IF()	=INDEX()
=INDIRECT()	=INT()	=IPMT()	=IRR()
=ISERR()	=ISERROR()	=ISNA()	=ISNUMBER()
=ISREF()	=ISTEXT()	=LEFT()	=LEN()
=LINEST()	=LN()	=LOG()	=LOG10()
=LOGEST()	=LOOKUP()	=LOWER()	=MATCH()
=MAX()	=MDETERM()	=MID()	=MIN()
=MINUTE()	=MINVERSE()	=MIRR()	=MMULT()
=MOD()	=MONTH()	=N()	=NA()
=NOT()	=NOW()	=NPER()	=NPV()
=OFFSET()	=OR()	=PI()	=PMT()
=PPMT()	=PRODUCT()	=PROPER()	=PV()
=RATE()	=REPLACE()	=REPT()	=RIGHT()
=ROUND()	=ROUND()	=ROW()	=ROWS()
=SEARCH()	=SECOND()	=SIGN()	=SIN()
=SLN()	=SQRT()	=STDEV()	=SUBSTITUTE()
=SUM()	=SYD()	=T()	=TAN()
=TEXT()	=TIME()	=TIMEVALUE()	=TODAY()

```
=TRANPOSE()  =TREND()      =TRIM()       =TRUE()  
=TYPE()      =UPPER()      =VALUE()      =VAR()  
=VLOOKUP()   =WEEKDAY()   =YEAR()
```

Set Minimum Image Size

You can set a minimum size limit for the images to export from spreadsheet files. This option can improve performance for documents that have lots of very small images.

To set the minimum image size, add the following lines to the `formats_e.ini` file:

```
[ss_flags]  
process_images_with_min_width=N  
process_images_with_min_height=M
```

where *N* and *M* are the minimum image dimensions, in pixels. For example:

```
[ss_flags]  
process_images_with_min_width=150  
process_images_with_min_height=250
```

Convert Presentation Files

Export has special configuration options that allow greater control over the conversion of presentation files.

Convert Presentation Files to Raster Images

Export allows you to convert each slide in a presentation document to a raster image, providing a high-fidelity conversion of the document.

The output format depends on the value of `bRasterizeFiles` in `KVHTMLOptionsEx`. See [KVHTMLOptionsEx](#), on page 208.

Convert Presentation Files to a Logical Reading Order

Some presentation files do not store the logical structure of the original document—the correct reading order, for example, and the presence and meaning of significant elements such as headers, footers, columns, tables, and so on.

In general, when you convert a presentation slide to a raster image, the output file retains the logical reading order because it uses the correct coordinates for each element in the output. However, if you do not use the `bRasterizeFiles` option in `KVHTMLOptionsEx` to produce a raster image, you might find that the export process generates output for some files that does not match the logical reading order.

When you do not want to rasterize your presentation files, you can use the `formats_e.ini` file to retain the logical reading order in your files.

The `formats_e.ini` file is in the directory `install\OS\bin`, where `install` is the path name of the Export installation directory and `OS` is the name of the operating system.

To enable logical reading order by using the `formats_e.ini` file

- In the `formats_e.ini` file, find the `[Options]` section, and set `LogicalOrder` to `1`.

For example:

```
[Options]
LogicalOrder=1
```

Convert XML Files

Export enables you to extract all or selected content from source XML files (see [Configure Element Extraction for XML Documents, below](#)). It detects the following XML formats:

- generic XML
- Microsoft Office 2003 XML (Word, Excel, and Visio)
- StarOffice/OpenOffice XML (text document, presentation, and spreadsheet)

See [File Format Detection, on page 362](#) for more information on format detection.

Configure Element Extraction for XML Documents

When you convert XML files, you can specify which elements and attributes are extracted according to the file's format ID or *root element*. This is useful when you want to extract only relevant text elements, such as abstracts from reports, or a list of authors from an anthology.

A root element is an element in which all other elements are contained. In the XML sample below, `book` is the root element:

```
<book>
  <title>XML Introduction</title>
  <product id="33-657" status="draft">XML Tutorial</product>
  <chapter>Introduction to XML
    <para>What is HTML</para>
    <para>What is XML</para>
  </chapter>
  <chapter>XML Syntax
    <para>Elements must have a closing tag</para>
    <para>Elements must be properly nested</para>
  </chapter>
</book>
```

For example, you could specify that when converting files with the root element `book`, the element `title` is extracted as metadata, and only `product` elements with a `status` attribute value of `draft` are extracted.

When you extract an element, the child elements within the element are also extracted. For example, if you extract the element `chapter` from the sample above, the child element `para` is also extracted.

Export defines default element extraction settings for the following XML formats:

- generic XML
- Microsoft Office 2003 XML (Word, Excel, and Visio)
- StarOffice/OpenOffice XML (text document, presentation, and spreadsheet)

These settings are defined internally and are used when converting these file formats; however, you can modify their values.

In addition to the default extraction settings, you can also add custom settings for your own XML document types. If you do not define custom settings for your own XML document types, the settings for the generic XML are used.

Modify Element Extraction Settings

You can modify configuration settings for XML documents through either the API or the `kvxconfig.ini` file.

NOTE: You can only use customized element extraction settings when converting files in process. When converting out of process, the default extraction settings are used.

Use the C API

You can use the C API to modify the settings for the standard XML document types or add configuration settings for your own XML document types.

To modify settings

1. Call the `fpInit()` function. See [fpInit\(\), on page 167](#).
2. Define the `KVXConfigInfo` structure. See [KVXConfigInfo, on page 199](#).
3. Call the `KVHTMLConfig()` function with the following arguments (see [KVHTMLConfig\(\), on page 170](#)):

Argument	Parameter
----------	-----------

<code>nType</code>	<code>KVCFG_SETXMLCONFIGINFO</code>
<code>nValue</code>	<code>0</code>
<code>pData</code>	address of the <code>KVXConfigInfo</code> structure

For example:

```
KVXConfigInfo xinfo; /* populate xinfo */
(*fpHTMLConfig)(pKVHTML, KVCFG_SETXMLCONFIGINFO, 0, &xinfo);
```

4. Repeat steps 2 and 3 until the settings for all the XML document types you want to customize are defined.
5. Call the `fpConvertStream()` or `KVHTMLConvertFile()` function. See [fpConvertStream\(\), on page 156](#) or [KVHTMLConvertFile\(\), on page 177](#).

Use an Initialization File

You can use the initialization file to modify the settings for the standard XML document types or add configuration settings for your own XML document types.

To modify settings

1. Modify the kvxconfig.ini file.
 2. Use the template file when processing the XML file.
- The C sample program `htmlini` demonstrates how to use a template file during the conversion process. See [Introduction, on page 112](#).

Modify Element Extraction Settings in the kvxconfig.ini File

The `kvxconfig.ini` file contains default element extraction settings for supported XML formats. The file is in the directory `install\OS\bin`, where `install` is the path name of the Export installation directory and `OS` is the name of the operating system. For example, the following entry defines extraction settings for the Microsoft Visio 2003 XML format:

```
[config3]
eKVFormat=MS_Visio_XML_Fmt
szRoot=
szInMetaElement=DocumentProperties
szExMetaElement=PreviewPicture
szInContentElement=Text
szExContentElement=
szInAttribute=
```

The following options are available.

Configuration Option	Description
eKVFormat	The format ID as detected by the KeyView detection module. This determines the file type to which these extraction settings apply. See File Format Detection, on page 362 for more information on format ID values. If you are adding configuration settings for a custom XML document type, this is not defined.
szRoot	The file's root element. When the format ID is not defined, the root element is used to determine the file type to which these settings apply. To further qualify the element, specify its namespace. See Specify an Element's Namespace and Attribute, on the next page .
szInMetaElement	The elements extracted from the file as metadata. All other elements are extracted as text. Multiple entries must be separated by commas. To further qualify the element, specify its namespace, its attributes, or both. See Specify an

Configuration Option	Description
	Element's Namespace and Attribute, on the next page.
szExMetaElement	<p>The child elements in the included metadata elements that are not extracted from the file as metadata. For example, the default extraction settings for the Visio XML format extract the <code>DocumentProperties</code> element as metadata. This element includes child elements such as <code>Title</code>, <code>Subject</code>, <code>Author</code>, <code>Description</code>, and so on. However, the child element <code>PreviewPicture</code> is defined in <code>szExMetaElement</code> because it is binary data and should not be extracted.</p> <p>You cannot exclude any metadata elements from the output for StarOffice files. All metadata is extracted regardless of this setting.</p> <p>Multiple entries must be separated by commas. To further qualify the element, specify its namespace, its attributes, or both. See Specify an Element's Namespace and Attribute, below.</p>
szInContentElement	<p>The elements extracted from the file as content text. Enter an asterisk (*) to extract all elements including child elements.</p> <p>Multiple entries must be separated by commas. To further qualify the element, specify its namespace, its attributes, or both. See Specify an Element's Namespace and Attribute, below.</p>
szExContentElement	<p>The child elements in the included content elements that are not extracted from the file as content text.</p> <p>Multiple entries must be separated by commas. To further qualify the element, specify its namespace, its attributes, or both. See Specify an Element's Namespace and Attribute, below.</p>
szInAttribute	<p>The attribute values extracted from the file. If attributes are not defined here, attribute values are not extracted.</p> <p>Enter the namespace (if used), element name, and attribute name in the following format:</p> <pre>namespace:elementname@attributename</pre> <p>For example:</p> <pre>keyview:division@name</pre> <p>Multiple entries must be separated by commas.</p>

Specify an Element's Namespace and Attribute

To further qualify an element, you can specify that the element must exist in a certain namespace, must contain a specific attribute, or both. To define the namespace *and* attribute of an element, enter the following:

```
ns_prefix:elemname@attribname=attribvalue
```

You must enclose attribute values that contain space in quotation marks.

For example, the following entry:

```
bg:language@id=xml
```

extracts a language element in the namespace bg that contains the attribute name id with the value of "xml". This entry extracts the following element from an XML file:

```
<bg:language id="xml">XML is a simple, flexible text format derived from  
SGML</bg:language>
```

but does not extract:

```
<bg:language id="sgml">SGML is a system for defining markup  
languages.</bg:language>
```

or

```
<adv:language id="xml">The namespace should be a Uniform Resource Identifier  
(URI).</adv:language>
```

Add Configuration Settings for Custom XML Document Types

You can define element extraction settings for custom XML document types by adding the settings to the kvxconfig.ini file. For example, for files containing the root element keyviewxml, you could add the following section to the end of the initialization file:

```
[config101]  
eKVFormat=  
szRoot=keyviewxml  
szInMetaElement=dc:title,dc:meta@title,dc:meta@name=title  
szExMetaElement=  
  
szInContentElement=keyview:division@name=dev,keyview:division@name=export,p@style="Heading 1"  
szExContentElement=  
szInAttribute=keyview:division@name
```

The custom extraction settings must be preceded by a section heading named [configN], where N is an integer that starts at 100 and increases by 1 for each additional file type (for example, [config100], [config101], [config102], and so on). The default extraction settings for the supported XML formats are numbered config0 to config99. Currently only 0 to 6 are used.

Because a custom XML document type is not recognized by the KeyView detection module, the format ID is not defined. The file type is identified by the file's root element only.

If a custom XML document type is not defined in the kvxconfig.ini file or by the KVHTMLConfig() function, the default extraction settings for a generic XML document are used.

Show Hidden Data

Microsoft Word, Excel, and PowerPoint documents contain hidden information, some of which is shown by default when exported, and some of which is hidden by default. There are several options

that allow you to determine which types of hidden data are shown.

Hidden Data in Microsoft Documents

You can show several types of hidden data from Microsoft Word, Excel, and PowerPoint documents, each of which has a corresponding flag in the [KVHTMLConfig\(\)](#), on page 170 function, which you can toggle to determine whether the hidden data is shown or not. [Hidden data settings, below](#) lists each data type, its default behavior, and its corresponding configuration API flag.

Hidden data settings

Hidden Data Type	Default Behavior	Configuration API Flag
Microsoft Word		
Comments ¹	Shown ²	KVCFG_WP_NOCOMMENTS
Hidden text	Hidden	KVCFG_WP_SHOWHIDDENTEXT
Date field codes	Calculated date	KVCFG_WP_SHOWDATEFIELDPCODE
File name field codes	Document file name	KVCFG_WP_SHOWFILENAMEFIELDPCODE
Microsoft Excel		
Hidden information	Hidden	KVCFG_SS_SHOWHIDDENINFOR
Comments	Hidden	KVCFG_SS_SHOWCOMMENTS
Formulas	Calculated value	KVCFG_SS_SHOWFORMULA
Microsoft PowerPoint		
Hidden slides	Shown	KVCFG_PG_HIDEHIDDENSLIDE
Comments	Shown ³	KVCFG_PG_HIDECOMMENT
Comments slide	Hidden	KVCFG_PG_SHOWCOMMENTSSSLIDE ⁴
Slide notes ⁵	Hidden	KVCFG_PG_SHOWSLIDENOTES

¹Word comment settings can also be toggled with a configuration parameter in the `formats_e.ini` file. See [Toggle Word Comment Settings in the formats_e.ini File, on the next page](#).

²Shown by default in Microsoft Word 97 to 2003 documents.

³Shown by default in Microsoft PowerPoint 97 to 2000 documents.

⁴This setting affects PowerPoint 2003 and 2007 only.

⁵PowerPoint slide note settings can also be toggled with a configuration parameter in the `formats_e.ini` file. See [Toggle PowerPoint Slide Note Settings in the formats_e.ini File, on the next page](#).

To toggle the display of any type of hidden data

- Use the configuration API and set the third parameter to TRUE or FALSE:

```
(*fpHTMLConfig)(pKVHTML, KVCFG_WP_NOCOMMENTS, TRUE, NULL)
```

In this example, comments will not be exported from Word documents.

NOTE: The third parameter affects the *default* behavior. To change the default behavior, set it to TRUE.

For more information, see [KVHTMLConfig\(\)](#), on page 170.

Toggle Word Comment Settings in the formats_e.ini File

Microsoft Word 97 to 2003 comment settings can also be controlled through a parameter in the `formats_e.ini` file.

The `formats_e.ini` file is in the directory `install\OS\bin`, where `install` is the path name of the Export installation directory and `OS` is the name of the operating system.

To toggle comment output in formats_e.ini

1. Open the `formats_e.ini` file in a text editor.
2. Under [Options], add the `WP_NOCOMMENTS` parameter and set it to 0 to show comments, or 1 to hide comments. For example:

```
[Options]  
WP_NOCOMMENTS=1
```

NOTE: The `KVCFG_WP_NOCOMMENTS` configuration API flag overrides the setting in `formats_e.ini`.

Toggle PowerPoint Slide Note Settings in the formats_e.ini File

Microsoft PowerPoint slide note settings can also be controlled through a parameter in the `formats_e.ini` file.

The `formats_e.ini` file is in the directory `install\OS\bin`, where `install` is the path name of the Export installation directory and `OS` is the name of the operating system.

To toggle slide note output in formats_e.ini

1. Open the `formats_e.ini` file in a text editor.
2. Under [Options], add the `ShowSlideNotes` parameter and set it to 1 to show slide notes, or 0 to hide slide notes. For example:

```
[Options]  
ShowSlideNotes=1
```

NOTE: The `KVCFG_PG_SHOWSLIDENOTES` configuration API flag overrides the setting in `formats_e.ini`.

Exclude Japanese Guide Text

This option prevents output of Japanese phonetic guide text when Microsoft Excel (.xlsx) files are processed.

To prevent output of Japanese phonetic guide text

- Set NoPhoneticGuides to TRUE in the formats_e.ini file:

```
[Options]  
NoPhoneticGuides=TRUE
```

You can also enable this option programatically when filtering by passing KVFLT_NOPHONETICGUIDES to fpFilterConfig.

Chapter 5: Sample Programs

This section describes the sample programs provided with HTML Export.

• Introduction	112
• tstxtract	114
• cnv2html	115
• cnv2htmlloop	116
• onefile	117
• index	118
• io_samp	118
• htmlini	118
• callback	120
• jvtree_demo	120
• jstree	121
• JVTree	121
• Export Demo	122
• Template Wizard	122
• comsamp	127
• htmlloop	127

Introduction

The sample programs demonstrate how to use the C, Visual Basic and COM implementations of HTML Export.

The sample code is intended to provide a starting point for your own applications or to be used for reference purposes.

The source code and makefile for each program are in the directory:

`install\htmlexport\programs\program_name`

where *install* is the path name of the Export installation directory, and *program_name* is the name of the sample program.

C Sample Programs

The C sample programs demonstrate how to use the C implementation of HTML Export. The following sample programs are provided:

- [tstxtract](#), on page 114
- [cnv2html](#), on page 115

- [cnv2htmlloop, on page 116](#)
- [onfile, on page 117](#)
- [index, on page 118](#)
- [io_samp, on page 118](#)
- [htmlini, on page 118](#)
- [callback, on page 120](#)

You can use the `tstextract`, `cnv2html`, `cnv2htmlloop`, and `htmlini` sample programs on Windows and UNIX. All other sample programs are for Windows only.

NOTE: The sample programs do not parse white space in file names. If your file names contain spaces, use quotation marks around the entire path name. Inserting quotation marks around the file name only does not work.

To compile the sample programs, use the makefiles provided in the sample programs' directory. Ensure the HTML Export `include` directory is specified in the include path of the project. After the executables are compiled and built, you must place them in the same directory as the HTML Export libraries.

Compile the Visual Basic Sample Program

To compile Export Demo, use the Visual Studio project file (`demo_vb.vbp`) in the directory `install\htmlexport\programs\ExportDemo`, where *install* is the path name of the Export installation directory. The executable is in the same directory.

COM Sample Program

The COM API is a COM interface to HTML Export and is available on 32-bit Windows platforms only. The interface is well suited for Visual Basic and Visual J++ programmers. The interface is an `IDispatch` interface, and can therefore be used with scripting environments such as Active Server Pages.

The following COM sample programs are provided:

- [Template Wizard, on page 122](#)
- [comsamp, on page 127](#)
- [htmlloop, on page 127](#)

To compile the Template Wizard, use the Visual Studio project file (`htmlvbwzd.vbp`) in the `install\htmlexport\programs\wizard` directory, where *install* is the path name of the Export installation directory.

To compile the `comsamp` sample program, use the Visual Studio project file (`comsamp.vbp`) in the `install\htmlexport\programs\comsamp` directory.

To compile `htmlloop`, use the Visual Studio project file (`htmlloop2.dsw`) in the `install\htmlexport\programs\htmlloop` directory.

tstxtract

The `tstxtract` sample program demonstrates the File Extraction API. It opens a file, extracts subfiles from the file, and repeats the extraction process until all subfiles are extracted. It also demonstrates how to extract the default set of metadata and pass integer or string names to extract specific metadata. After the files are extracted, you can convert the files by using one of the conversion sample programs.

The source code for the `tstxtract` sample program is the same for the Filter and Export SDKs. A flag in the makefile specifies whether the program is compiled for Filter, HTML Export, or XML Export.

To run `tstxtract`, type the following at the command line:

```
tstxtract [options] input_file output_directory bin_directory
```

where `options` is one or more of the following.

Option	Description
-c charset	Specify the target character set, for example <code>KVCS_SJIS</code> . See Coded Character Sets, on page 316 for a full list of supported character sets.
-cf keyfile1, keyfile2,...	Specify one or more credential files (private keys) to use to decrypt encrypted .EML, .MBX, .PST, or .MSG files.
-l logfile	Specify the path and file name of the log file in which metadata is written.
-lm	Retrieve metadata and write the data to the log file.
-lms metaname1, metaname2, ...	Retrieve metadata with string metanames and write the data to the log file for .MSG, .EML, .MBX, and .NSF files.
-lmi metaint1, metaint2,...	Retrieve metadata with integer (hexadecimal) metanames and write the data to the log file for .PST files.
-lma	Retrieve all metadata from an .NSF file and write the data to the log file.
-r	Recursively extract second-level subfiles to the specified output directory. For example, if a .ZIP file contains a Microsoft Word file and the Word file contains an embedded Microsoft Excel file, set the <code>-r</code> option to extract both the Word and Excel files. If this option is not set, only first-level subfiles are extracted. For the example above, only the Word file would be extracted.
-msg	Extract mail messages in a .PST file as an .MSG file, including all of its attachments. If this flag is not set, the mail message is extracted as text. This option applies to PST files on Windows only.

Option	Description
-f	Extract the formatted version of the message body (HTML or RTF) from mail files when possible. If neither an HTML nor RTF version of the message body exists in the mail file, then it is extracted as plain text. If this flag is not set, the message body is extracted as plain text when possible.
-t	Preserve the timestamp of embedded files when possible.
-h	Extract hidden text.

input_file is the full path and file name of the source document.

output_directory is the directory to which the files will be extracted.

bin_directory is the path to the Export *bin* directory. This is required if you do not run the program from the *install\Export SDK\bin* directory.

cnv2html

The *cnv2html* sample program creates a single, formatted HTML output file. It is called by the Export Demo sample program, but can also be used on its own.

To run *cnv2html*, type the following at the command line:

```
cnv2html [options] inputfile outputfile
```

where:

options is one or more of the options listed in [below](#).

inputfile is the full path and file name of the source document.

outputfile is the full path and file name of the HTML output file.

The following options are available.

Option	Description
-c KVCFG_SETHIFIPDF	<p>This option specifies the type of reader used to convert PDF documents. In Export, you can convert PDF documents by using either the graphic-based PDF reader, named <i>kppdfldr</i>, or the basic PDF reader, named <i>pdfsr</i>. For more information on each reader, see Convert PDF Files to Raster Images, on page 92.</p> <p>By default, the basic reader (<i>pdfsr</i>) is used to convert PDF documents.</p>
-c KVCFG_SETTEXTROTATE	<p>This option specifies that rotated text should be displayed at the bottom of a page on which it appears. By default, rotated text in a file is displayed in its original position, at the original font size, and at 0 degrees rotation. The text is not rotated in the output because text rotation is not supported by HTML. See Convert Rotated Text, on page 97 for more information.</p> <p>Currently, this configuration option applies only to PDF files.</p>

, continued

Option	Description
-c KVCFG_ DELSOFTHYPHEN	This option specifies that soft hyphens in PDF files are deleted from the converted output. See Control Hyphenation, on page 98 .
-c KVCFG_ SETPDFINVISTEXT TOGGLE ButtonName	y.
-pdfauto	This option specifies that PDF files are output in a logical reading order. The PDF reader determines the paragraph direction (left-to-right or right-to-left) for each PDF page, and then sets the direction accordingly. See Convert PDF Files to a Logical Reading Order, on page 92 .
-pdfltr	This option specifies that PDF files are output in a logical reading order, and the paragraph direction is left to right. See Convert PDF Files to a Logical Reading Order, on page 92 .
-pdfrtl	This option specifies that PDF files are output in a logical reading order, and the paragraph direction is right to left. See Convert PDF Files to a Logical Reading Order, on page 92 .
-pdfraw	This option specifies that PDF files are output in an unstructured paragraph flow. This is the default. Set this flag if logical reading order is enabled, and you want to return to an unstructured paragraph flow. See Convert PDF Files to a Logical Reading Order, on page 92 .

cnv2htmlloop

The `cnv2htmlloop` sample program creates a single, formatted HTML output file, but unlike `cnv2html1`, it converts the file out of process. See [Convert Files Out of Process, on page 29](#) for more information on out of process conversions.

To run `cnv2htmlloop`, type the following at the command line:

```
cnv2htmlloop [options] inputfile outputfile
```

where:

options is one or more of the options listed in [below](#).

inputfile is the full path and file name of the source document.

outputfile is the full path and file name of the HTML output file.

The following options are available.

Option	Description
-f	Convert by using out-of-process file mode (default)

, continued

Option	Description
-s	Convert by using out-of-process stream mode
-c KVCFG_SETHIFIPDF	This option specifies the type of reader used to convert PDF documents. In Export, you can convert PDF documents by using either the graphic-based PDF reader, named <code>kppdfrdr</code> , or the basic PDF reader, named <code>pdfsr</code> . For more information on each reader, see Convert PDF Files to Raster Images, on page 92 . By default, the basic reader (<code>pdfsr</code>) is used to convert PDF documents.
-c KVCFG_SETTEXTROTATE	This option specifies that rotated text should be displayed at the bottom of a page on which it appears. By default, rotated text in a file is displayed in its original position, at the original font size, and at 0 degrees rotation. The text is not rotated in the output because text rotation is not supported by HTML. See Convert Rotated Text, on page 97 for more information. Currently, this configuration option applies only to PDF files.
-c KVCFG_DELSOFTHYPHEN	This option specifies that soft hyphens in PDF files are deleted from the converted output. See Control Hyphenation, on page 98 .
-pdfauto	This option specifies that PDF files are output in a logical reading order. The PDF reader determines the paragraph direction (left-to-right or right-to-left) for each PDF page, and then sets the direction accordingly. See Convert PDF Files to a Logical Reading Order, on page 92 .
-pdfltr	This option specifies that PDF files are output in a logical reading order, and the paragraph direction is left to right. See Convert PDF Files to a Logical Reading Order, on page 92 .
-pdfrtl	This option specifies that PDF files are output in a logical reading order, and the paragraph direction is right to left. See Convert PDF Files to a Logical Reading Order, on page 92 .
-pdfraw	This option specifies that PDF files are output in an unstructured paragraph flow. This is the default. Set this flag if logical reading order is enabled, and you want to return to an unstructured paragraph flow. See Convert PDF Files to a Logical Reading Order, on page 92 .

onefile

The `onefile` sample program converts a source document into a single, formatted HTML file.

To run `onefile`, type the following at the command line:

```
onefile inputfile outputfile
```

where:

inputfile is the full path and file name of the source document.

outputfile is the full path and file name of the HTML output file.

index

The `index` sample program produces minimal HTML output suitable for use with indexing engines. It converts a source document into a single, largely unformatted HTML file.

To run `index`, type the following at the command line:

```
index inputfile outputfile
```

where:

inputfile is the full path and file name of the source document.

outputfile is the full path and file name of the HTML output file.

io_samp

The `io_samp` sample program demonstrates how to create an input and an output stream by providing a simple wrapper around the ANSI C interface `fOpen()`, `fRead()`, `fSeek()`, `fTell()`, and `fClose()`. It converts a source document into a single, largely unformatted HTML file.

To run `io_samp`, type the following at the command line:

```
io_samp inputfile outputfile
```

where:

inputfile is the full path and file name of the source document.

outputfile is the full path and file name of the HTML output file.

htmlini

The `htmlini` sample program is used in conjunction with template files to produce HTML documents. For more information on template files, see [Set Conversion Options by Using the Template Files, on page 38](#). Sample template files are in the directory `install\htmllexport\programs\ini`. You can use this sample program on Windows and UNIX platforms.

To run `htmlini`, type the following at the command line:

```
htmlini [options] infile inputfile outputfile
```

where:

options is one or more of the options listed in [, on the next page](#).

infile is the full path and file name of a template file.

inputfile is the full path and file name of the source document.

outputfile is the full path and file name of the first HTML output file.

The following options are available.

Option	Description
-c css_ filename	This option writes Cascading Style Sheet (CSS) information to an external file. See Use Style Sheets with htmlini , on the next page.
-x xmlconfig_ path	This option converts an XML file by using customized element extraction settings defined in the <code>kvxconfig.ini</code> file. If you do not enter the full path to the template file, the program looks for the file in the current working directory (<i>install\OS\bin</i> , where <i>install</i> is the path name of the Export installation directory and <i>OS</i> is the name of the operating system). See Convert XML Files , on page 104.
-hl term term term	This option specifies the text string or strings that are found and highlighted in the HTML output. You can specify a maximum of three terms. See Search and Highlight Terms , on page 85.
-hc charset	This option specifies the character set of the highlighted search terms in the HTML output.
-hi	This option specifies that the text search is case insensitive. You can use this option only when the target character set for the highlighted search term is <code>KVCS_1252</code> .
-rm	<p>This option converts text and graphics that were deleted from a document with revision tracking enabled, and includes revision information in the HTML output. See Include Revision Information, on page 86.</p> <p>This option uses the following hard-coded defaults:</p> <ul style="list-style-type: none"> the revision title includes the text string "inserted:" for <code><ins></code> tags and "deleted:" for <code></code> tags. the revision title includes the reviewer name, date, and time. defines two HTML styles used to highlight reviewers' edits. creates a revision summary file.
-bp	This option prevents graphics from being converted and generates image tags with empty <code>src</code> attributes. This makes the conversion faster, and maintains the text flow of the original document, because placeholders are generated for the graphics.
-oop	This option runs the conversion out of process.
-fl	This option prints a list of converted files in the console.
-pi ButtonName	This option enables a toggle button in exported PDF documents that you can click to show or hide invisible text. <code>ButtonName</code> determines the name of the toggle button. See Toggle Invisible Text , on page 96.
-ov OpacityValue	This option specifies the opacity of invisible text in exported PDF documents. <code>OpacityValue</code> is an integer from 0 (invisible) to 100 (fully visible). The default is 0. See Specify Opacity of Invisible Text , on page 97.

If the HTML file is output to a directory other than `programs\tempout`, you must update the HTML markup so that the browser can find images used by the templates (such as backgrounds or corporate logos) and the style sheet. The markup contains relative references to the image files (`..\images`).

Use Style Sheets with `htmlini`

The `htmlini` sample program has an option that allows Cascading Style Sheet (CSS) information to be written to an external file. This makes the HTML output document significantly smaller and enables you to use the same style sheet for many conversions. If the style sheet does not exist or if it is empty, it is created.

To write CSS information to an external file:

1. In the template file, set `eStyleSheetType` to `CSS_TOFILE`. This specifies that the formatting data is stored in a CSS file.
2. In the template file, use the `$STYLESHEET` token to specify the URL of the style sheet in the HTML output. The external CSS file is referenced in the output HTML by a `LINK` statement of the form:

```
<LINK rel="STYLESHEET" href="CSS_file" type="text/css">
```

3. At the command prompt, type:

```
htmlini -c stylesheetname inifile inputfile outputfile
```

where *stylesheetname* is the path and file name of the CSS file.

callback

The `callback` sample program demonstrates how you can control the conversion to generate specialized output while it is in progress. The program employs developer-defined callbacks and memory management functions during conversion.

To run `callback`, type the following at the command line:

```
callback inputfile outputfile
```

where:

inputfile is the full path and file name of the source document.

outputfile is the full path and file name of the first HTML output file.

jvtree_demo

The C program `jvtree_demo` creates a frame-based HTML stream which uses the `JVTree.jar` to display the table of contents.

To compile the `jvtree_demo` sample program, use the makefile (`kvhtml.mak`) in the directory `install\htmlexport\programs\jvtree_demo`, where *install* is the path name of the Export installation directory.

To run `jvtree_demo`, type the following at the command line:

```
jvtree inputfile outputfile.htm
```

where:

inputfile is the full path and file name of the source document.

outputfile.htm is the full path and file name of the first HTML output file.

NOTE: This program requires the Java Runtime Environment (JRE) 1.3 or higher.

The Java applet, `JVTree.jar`, must be in the same directory as the HTML Export libraries and the output HTML files.

Set the `CLASSPATH` environment variable to include the location of the `\lib` directory and `lib\tools.jar` file for the JDK installed on the machine. Multiple path entries should be separated by semicolons. You must also include the current directory in the search path by using `."` in the new setting.

jstree

The `jstree` sample program uses JavaScript to produce an expandable tree view of the table of contents in a frame-based HTML output file.

To compile the `jstree` sample program, use the makefile (`kvhtml.mak`) in the directory `install\htmlexport\programs\jstree`, where `install` is the path name of the Export installation directory.

To run `jstree`, type the following at the command line:

```
jstree inputfile outputfile.htm
```

where:

inputfile is the full path and file name of the source document.

outputfile.htm is the full path and file name of the first HTML output file.

NOTE: You must place the following files in the same directory as the output HTML for the table of contents to function:

```
false.gif  
true.gif  
resize.js  
list.js
```

JVTree

The `JVTree` sample program employs user callbacks and a Java applet to produce an expandable tree view of the table of contents in a frame-based HTML output file.

To compile the `JVTree` sample program, use the makefile (`kvhtml.mak`) in the directory `install\htmlexport\programs\jvtree`, where `install` is the path name of the Export installation directory.

To run JVTtree, type the following at the command line:

```
jvtree inputfile outputfile.htm
```

where:

inputfile is the full path and file name of the source document.

outputfile.htm is the full path and file name of the first HTML output file.

NOTE: This program requires the Java Runtime Environment (JRE) 1.5 or higher.

The Java applet, JVTtree.jar, must be in the same directory as the HTML Export libraries and the output HTML files.

Set the CLASSPATH environment variable to include the location of the \lib directory and lib\tools.jar file for the JDK installed on the machine. Separate multiple path entries with semicolons. You must also include the current directory in the search path by using "." in the new setting.

Export Demo

Export Demo is a Visual Basic program that provides an easy-to-use graphical user interface to the Export technology. It allows you to select files, convert them to HTML, and view the result in a browser object. The output options that control the look of the output files are predefined in Export Demo and cannot be changed in the user interface.

Export Demo accesses the Export functionality by returning to the operating system and running a C program named *cnv2html*. To adapt the sample program to your needs, modify the GUI by using Visual Basic, and modify the *cnv2html* program by using C. For more information on the C program, see [htmlini](#), on page 118.

To launch Export Demo, select **Export Demo** from **Start | Programs | Autonomy | Export SDK | HTML Export**.

The source code for the program is in the directory *install\htmlexport\programs\ExportDemo*, where *install* is the path name of the Export installation directory. Export Demo is for Windows only.

See [Use the Export Demo Program](#), on page 40 for more information.

Template Wizard

The Template Wizard is a Visual Basic program that provides an easy-to-use graphical user interface to the Export technology. It is an example of how to use most of the properties, methods, and events available in the COM Automation Server. See [COM Interface Methods and Events](#), on page 247 and [COM Interface Properties](#), on page 252 for more information on the properties and methods.

The Template Wizard converts documents based on the predefined templates. Several templates are supplied with HTML Export, and they can be customized to suit your needs. See [Set Conversion Options by Using the Template Files](#), on page 38 for details on the template files.

NOTE: The Template Wizard requires a COM server to be registered. See [Use the COM Implementation of the API, on page 47](#).

You can use the Template Wizard to modify existing template files to create your own customized files, and to convert documents to HTML. However, the Template Wizard does not allow you to modify all structures in the template files. To control some display options, you might have to modify the template files directly or use the API.

Convert Documents to HTML by Using the Template Wizard

To convert a document to HTML

1. Launch HTML Export Template Wizard.

2. Click **Choose Template**.
3. Select one of the templates listed in the Choose Template dialog box, or click the browse button to select another template file. The template files are located in the `programs\ini` directory. Click **OK**.
4. Select an input file by using the browse button next to the **Input File** field.
5. Click **Convert to HTML** to produce an HTML file of the source document.
6. Click **View HTML** to open the converted file in your browser. To specify which browser is used to view the converted HTML files, click **Change Browser**.

When you change the default browser, the location of the browser's executable file is written to a file named `browser.wiz`. If the browser is not changed, the default browser is the Visual Basic web browser object\OCX.

Change the Output Directory

By default, the output file is stored in the `programs\tempout` directory. To change this directory, click the browse button next to the **Output Directory** field and select a new directory.

If you change the default output directory, you must make the following modifications to the templates:

1. Update the HTML markup so that any images used by the templates (such as backgrounds or corporate logos) are found by the browser. The markup contains relative references to the image files (`..\images`).
2. Update the templates so that the Java applet (`JVTree.jar`) is found.

NOTE: `JVTree.jar` is used to display a expandable table of contents. [JVTree](#), on page 121 for more information on `JVTree.jar`.

To delete the HTML and image files created in the output directory, click **Delete Created Output Files**.

Modify a Template in the Wizard

The Template Wizard provides limited control over the templates. You might wish to modify the template files directly in a text editor to provide maximum customization of the converted HTML. See [Set Conversion Options by Using the Template Files](#), on page 38.

To modify the default options specified in the Wizard

1. Click **Modify Template**.
2. Modify the properties in the **Options** dialog box. The template parameters associated with each option in the **Options** dialog box are listed below and are described in [HTML Export API Structures](#), on page 192.

Wizard field	Template parameter
All Formats tab	
Use text color in the original document	<code>bUseDocumentColors</code>
Use font information in the original document	<code>bUseDocumentFontInfo</code>
Use font face attributes in the document	<code>bSupportFontFace</code>
Set font size relative to base font size	<code>bDisplayRelativeFontSize</code>
Support user font size mapping	<code>bSupportUserFontSizeMapping</code>
User Font Size Map	<code>FontSizeMap</code>
Emit <code><td>\$nbsp;</td></code> for empty cells	<code>bNbspEmptyCells</code>
Support "col=x" HTML parameter	<code>bSupportRFC1942_cols</code>
Convert tabs to tables	<code>bTabsToTables</code>
Table Border	<code>SATableBorder</code>
Table Cell Width	<code>nTableBorderWidth</code>
Output Language ID	<code>OutputLanguageID</code>
Style Sheet Type	<code>eStyleSheetType</code>
Replace Character	<code>cReplaceChar</code>

Wizard field	Template parameter
Redact Character	cRedact
Word Processing tab	
Minimum length of paragraph	minParaLen
Maximum length of paragraph	maxParaLen
Minimum font size	fontSizeMin
Maximum font size	fontSizeMax
Required space before paragraph	mSpaceBefore
Required space after paragraph	mSpaceAfter
Must be bold	bMustBeBold
Must be italic	bMustBeItalic
Must be underlined	bMustBeUnderlined
Can be non-zero indent	bNonZeroIndent
Cannot contain tab	bNoTabs
Cannot contain two or more spaces	bNoMultiSpaces
Heading Create Options	headingCreateType
Force source character set	bForceSrcCharSet
Source Character Set	eSrcCharSet
Force output character set	bForceOutputCharSet
Output Character Set	OutputCharSet
Spreadsheet tab	
Support column width	bSupportColumnWidth
Generate column headings	bSupportColumnHeadings
Generate row headings	bSupportRowHeadings
Support cell span	bSupportCellSpan
Support row span	bSupportRowSpan
Remove empty columns	bRemoveEmptyColumns
Enable empty rows	bEnableEmptyRows
Specify maximum rows per table	nRowsBeforeSplit
Presentation/Image tab	

Wizard field	Template parameter
Output any raster images to the following format	OutputRasterGraphicType
Output any vector images to the following format	OutputVectorGraphicType
Resolution of output image in x direction	cxVectorToRasterXRes
Resolution of output image in y direction	cyVectorToRasterYRes
Output presentation graphics as text and images	bRasterizeFiles
No pictures	bNoPictures
Compression quality	nCompressionQuality
Paragraph Styles tab	
Style Name	StyleName
MarkUpStart	MarkUpStart
MarkUpEnd	MarkUpEnd
Heading 1	Flags=KVSTYLE_HEADING1 (see Flags for Defining Styles, on page 83)
Heading 2	Flags=KVSTYLE_HEADING2 (see Flags for Defining Styles, on page 83)
Heading 3	Flags=KVSTYLE_HEADING3 (see Flags for Defining Styles, on page 83)
Heading 4	Flags=KVSTYLE_HEADING4 (see Flags for Defining Styles, on page 83)
Heading 5	Flags=KVSTYLE_HEADING5 (see Flags for Defining Styles, on page 83)
Heading 6	Flags=KVSTYLE_HEADING6 (see Flags for Defining Styles, on page 83)
PRE	Flags=KVSTYLE_PRE (see Flags for Defining Styles, on page 83)
Redact	Flags=KVSTYLE_REDACT (see Flags for Defining Styles, on page 83)
Order List	Flags=KVSTYLE_ORDERLIST (see Flags for Defining Styles, on page 83)
Unordered List	Flags=KVSTYLE_UNORDERLIST (see Flags for Defining Styles, on page 83)
Delete Content	Flags=KVSTYLE_DELETECONTENT (see Flags for Defining Styles, on page 83)

Wizard field	Template parameter
On Consecutive Paragraphs	Flags=ONCONSECUTIVEPARAGRAPHS (see Flags for Defining Styles, on page 83)

3. You can use the **Paragraph Styles** tab to map paragraph and character styles in any word processing document that contains styles (such as Microsoft Word, RTF, or Folio Flat File) to arbitrary markup.
4. To create a new template that preserves any modifications that have been made, click **Save Template as Ini File**.

comsamp

This Visual Basic program illustrates how to use the properties, methods, and events of the ActiveX controls from within Visual Basic. Before you can use this sample you must:

- Register an `htmserve` COM object. See the registration instructions in [Use the COM Implementation of the API, on page 47](#).
- If required, specify the location of the HTML Export binaries and the default directory containing source files.

More detailed information on properties, methods, and events is found in [COM Interface Methods and Events, on page 247](#) and [COM Interface Properties, on page 252](#).

htmlloop

The `htmlloop` sample program demonstrates how to use the COM interface from within a C++ application. Using the COM interface allows C++ developers to take advantage of out-of-process HTML conversion.

To run `htmlloop`, type the following command:

```
htmlloop install, inifile, inputfile, outputfile.htm
```

where:

install is the directory where the Export libraries are installed.

inifile is the full path and file name of a template file.

inputfile is the full path and file name of the source document.

outputfile.htm is the full path and file name of the HTML output file.

NOTE: You must separate the arguments with commas (,). You must **not** enclose directory names that contain spaces in quotation marks. This program does not indicate when the conversion has finished.

Part III: C API Reference

This section provides detailed reference information for the C-language implementation of the File Extraction and Export APIs.

- [File Extraction API Functions](#)
- [File Extraction API Structures](#)
- [HTML Export API Functions](#)
- [HTML Export API Callback Functions](#)
- [HTML Export API Structures](#)
- [Enumerated Types](#)

Chapter 6: File Extraction API Functions

This section describes the functions in the File Extraction API. The File Extraction functions open a container file, and extract the container's subfiles so that the subfiles are exposed and available for conversion. Subfiles can be files within a Zip archive, messages in a mail store, attachments in a mail message, or OLE objects embedded in a compound document.

Each function appears as a function prototype followed by a description of its arguments, its return value, and a discussion of its use.

• KVGetExtractInterface()	129
• fpCloseFile()	130
• fpExtractSubFile()	130
• fpFreeStruct()	132
• fpGetMainFileInfo()	133
• fpGetSubFileInfo()	134
• fpGetSubFileMetaData()	135
• fpOpenFile()	137

KVGetExtractInterface()

This function is the entry point to obtain the file extraction functions. It supplies pointers to the file extraction functions, and in the case of out-of-process mode starts the `kvoop.exe` server and initializes out-of-process extraction services. When `KVGetExtractInterface()` is called, it assigns the function pointers in the structure `KVExtractInterface` to the functions described in this section.

Syntax

```
int pascal KVGetExtractInterface (  
    void *pContext,  
    KVExtractInterface pIextract);
```

Arguments

pContext A pointer returned from `fpInit()`.

pIextract A pointer to the [KVExtractInterface](#) structure, which contains function pointers that `KVGetExtractInterface()` assigns to all other file extraction functions.

Before you initialize the `KVExtractInterface` structure, use the macro `KVStructInit` to initialize the `KVStructHead` structure.

Returns

- If the call is successful, the return value is `KVERR_Success`.
- If the call is not successful, the return value is an error code.

Example

```
fpKVGetExtractInterface =  
(int (pascal *) ( void *, KVExtractInterface))myGetProcAddress(hKVExport, (char*)  
"KVGetExtractInterface");  
/*Initialize file extraction interface structure using KVStructInit*/  
KVStructInit(&extractInterface);  
/* Retrieve file extraction interface */  
error = (*fpKVGetExtractInterface)(pExport,&extractInterface))
```

fpCloseFile()

This function frees the memory allocated by [fpOpenFile\(\)](#) and closes the file.

Syntax

```
int (pascal *fpCloseFile) (void *pFile);
```

Arguments

`pFile` The identifier of the file. This is a file handle returned from [fpOpenFile\(\)](#).

Returns

- If the file is closed, the return value is `KVERR_Success`.
- If the file is not closed, the return value is an error code.

Example

```
extractInterface->fpCloseFile(pFile);  
pFile = NULL;
```

fpExtractSubFile()

This function extracts a subfile from a container file to a user-defined path or output stream. This call returns file format information when file is extracted to a path.

Syntax

```
int (pascal *fpExtractSubFile) (
    void                *pFile,
    KVExtractSubFileArg  extractArg,
    KVSubFileExtractInfo *extractInfo);
```

Arguments

pFile	The identifier of the file. This is a file handle returned from fpOpenFile() .
extractArg	<p>A pointer to the structure KVExtractSubFileArg, which defines the subfile to be extracted.</p> <p>Before you initialize the KVExtractSubFileArg structure, use the macro KVStructInit to initialize the KVStructHead structure.</p>
extractInfo	A pointer to the structure KVSubFileExtractInfo, which defines information about the extracted subfile.

Returns

- If the subfile is extracted from the container file, the return value is KVERR_Success.
- If the subfile is not extracted from the container file, the return value is an error code.

Discussion

- After the file is extracted, call [fpFreeStruct\(\)](#) to free the memory allocated by this function.
- If the subfile is embedded in the main file as a link and is stored externally, extractInfo->infoFlag is set to KVSubFileExtractInfoFlag_External.

For example, the subfile might be an object that was embedded in a Word document by using "Link to File," or an attachment that is referenced in an MBX message. This type of subfile cannot be extracted. You must write code to access the subfile based on the path in the member extractInfo->filePath or extractInfo->fileName. See [KVSubFileExtractInfo, on page 149](#).

Example

```
KVSubFileExtractInfo  extractInfo = NULL;

KVStructInit(&extractArg);

extractArg.index = index;
extractArg.extractionFlag = KVExtractionFlag_CreateDir | KVExtractionFlag_Overwrite;
extractArg.filePath = subFileInfo->subFileName;
```

```
/*Extract this subfile*/  
error=extractInterface->fpExtractSubFile(pFile,&extractArg,&extractInfo);  
if ( error )  
{  
    extractInterface->fpFreeStruct(pFile,extractInfo);  
    subFileInfo = NULL;  
}
```

fpFreeStruct()

This function frees the memory allocated by `fpGetMainFileInfo()`, `fpGetSubFileInfo()`, `fpGetSubFileMetadata()`, and `fpExtractSubFile()`.

Syntax

```
int (pascal *fpFreeStruct) (  
    void      *pFile,  
    void      *obj);
```

Arguments

pFile The identifier of the file. This is a file handle returned from [fpOpenFile\(\)](#).
obj A pointer to the result object returned by `fpGetMainFileInfo()`, `fpGetSubFileInfo()`, `fpGetSubFileMetaData`, or `fpExtractSubFile()`.

Returns

- If the allocated memory is freed, the return value is `KVERR_Success`.
- Otherwise, the return value is an error code.

Example

The example below frees the memory allocated by `fpGetSubFileInfo()`:

```
if ( subFileInfo )  
{  
    extractInterface->fpFreeStruct(pFile,subFileInfo);  
    subFileInfo = NULL;  
}
```

fpGetMainFileInfo()

This function determines whether a file is a container file—that is, whether it contains subfiles—and should be extracted further.

Syntax

```
int (pascal *fpGetMainFileInfo) (  
    void                *pFile,  
    KVMMainFileInfo     *fileInfo);
```

Arguments

- pFile** The identifier of the file. This is a file handle returned from [fpOpenFile\(\)](#).
- fileInfo** A pointer to the structure [KVMMainFileInfo](#). This structure contains information about the file.

Returns

- If the file information is retrieved, the return value is `KVERR_Success`.
- If the file information is not retrieved, the return value is an error code.

Discussion

After the file information is retrieved, call [fpFreeStruct\(\)](#) to free the memory allocated by this function.

If the file is a container (`fileInfo->numSubFiles` is non-zero), call [fpGetSubFileInfo\(\)](#) and [fpExtractSubFile\(\)](#) for each subfile.

If the file is not a container (`fileInfo->numSubFiles` is 0) and contains text (`fileInfo->infoFlag` is set to `KVMMainFileInfoFlag_HasContent`), pass the file directly to the conversion functions.

Example

```
KVMMainFileInfo  fileInfo    = NULL;  
if( (error=extractInterface->fpGetMainFileInfo(pFile,&fileInfo)))  
{  
    /* Free result object allocated in fileInfo */  
    extractInterface->fpFreeStruct(pFile,fileInfo);  
    fileInfo = NULL;  
}
```

fpGetSubFileInfo()

This function gets information about a subfile in a container file.

Syntax

```
int (pascal *fpGetSubFileInfo) (  
    void                *pFile,  
    int                 index,  
    KVSubFileInfo       *subFileInfo);
```

Arguments

pFile The identifier of the main file. This is a file handle returned from [fpOpenFile\(\)](#).

index The index number of the subfile for which to retrieve information.

subFileInfo A pointer to the [KVSubFileInfo](#) structure, which defines information about the subfile.

Returns

- If the file information is retrieved, the return value is `KVERR_Success`.
- If the file information is not retrieved, the return value is an error code.

Discussion

- After the subfile information is retrieved, call [fpFreeStruct\(\)](#) to free the memory allocated by this function.
- If the root node is *not* enabled, the first subfile is index 0. If the root node is enabled, the first subfile is index 1. The root node is required to recreate a file's hierarchy. See [Create a Root Node, on page 53](#).
- The members `subFileInfo->parentIndex` and `subFileInfo->childArray` enable you to recreate a file's hierarchy. Because `childArray` retrieves only the first-level children in the subfile, you must call `fpGetSubFileInfo()` repeatedly until information for the leaf-node children is extracted. See [Recreate a File's Hierarchy, on page 53](#).
- If the subfile is embedded in the main file as a link and is stored externally, `subFileInfo->infoFlag` is set to `KVSubFileInfoFlag_External`. For example, the subfile might be an object that was embedded in a Word document by using "Link to File," or an attachment that is referenced in an MBX message. This type of subfile cannot be extracted. You must write code to access the subfile based on the path in the member `subFileInfo->subFileName`. See [KVSubFileInfo, on page 150](#).
- The `KVSubFileInfoFlag_External` flag is not set for an OLE object that is embedded as a link in a Microsoft PowerPoint file. KeyView can detect linked objects in a Microsoft PowerPoint file only when the object is extracted. See [fpExtractSubFile\(\), on page 130](#).

Example

```
KVSubFileInfo    subFileInfo = NULL;
for ( index = 0; index < fileInfo->numSubFiles; index++)
{
    error=extractInterface->fpGetSubFileInfo(pFile,index,&subFileInfo);
    if ( error )
    {
        extractInterface->fpFreeStruct(pFile,subFileInfo);
        subFileInfo = NULL;
    }
}
```

fpGetSubFileMetaData()

This function extracts metadata from mail stores, mail messages, and non-mail items in an NSF file.
See [Extract Mail Metadata, on page 54](#).

Syntax

```
int (pascal *fpGetSubFileMetaData) (
                                void                *pFile,
                                KVGetSubFileMetaArg metaArg,
                                KVSubFileMetaData    *metaData);
```

Arguments

- | | |
|-----------------|--|
| pFile | The identifier of the file. This is a file handle returned from fpOpenFile() . |
| metaArg | A pointer to the KVGetSubFileMetaArg structure, which defines metadata tags whose values are retrieved.

Before you initialize the KVGetSubFileMetaArg structure, use the KVStructInit macro to initialize the KVStructHead structure. |
| metaData | A pointer to the KVSubFileMetaData structure, which contains the retrieved metadata values. |

Returns

- If the metadata is retrieved, the return value is KVERR_Success.
- If the metadata is not retrieved, the return value is an error code.

Discussion

- When you pass in 0 for metaArg->metaNameCount, and NULL for metaArg->metaNameArray, a set of default metadata is retrieved. See [Extract Mail Metadata, on page 54](#).
- After the metadata is retrieved, call [fpFreeStruct\(\)](#) to free the memory allocated by this function.
- If a field is repeated in an EML or MBX mail header, the values in each instance of the field are concatenated and returned as one field. The values are separated by five pound signs (#####) as a delimiter.

Example

```
KVSubFileMetaData  metaData = NULL;

KVStructInit(&metaArg);

/* retrieve all the default metadata elements */
metaArg.metaNameCount = 0;
metaArg.metaNameArray = NULL;
metaArg.index = Index;

error = extractInterface->fpGetSubFileMetaData(pFile,&metaArg,&metaData);
...

extractInterface->fpFreeStruct(pFile,metaData);
metaData = NULL;

/* retrieve specific metadata fields */
KVMetaName  pName[2];
KVMetaNameRec names[2];

names[0].type = KVMetaNameType_Integer;
names[0].name.iname = KVPR_SUBJECT;

names[1].type = KVMetaNameType_Integer;
names[1].name.iname = KVPR_DISPLAY_TO;

pName[0] = &names[0];
pName[1] = &names[1];

metaArg.metaNameCount = 2;
metaArg.metaNameArray = pName;
metaArg.index = Index;

error = extractInterface->fpGetSubFileMetaData (pFile,&metaArg,&metaData);
...
```

```
extractInterface->fpFreeStruct(pFile, metaData);  
metaData = NULL;
```

fpOpenFile()

This function opens a file to make the file accessible for subfile extraction or conversion.

Syntax

```
int (pascal *fpOpenFile) (  
    void                *pContext,  
    KVOpenFileArg       openArg,  
    void                **pFile);
```

Arguments

- pContext** A pointer returned from `fpInit()`.
- openArg** A pointer to the [KVOpenFileArg](#) structure. This structure defines the input parameters necessary to open a file for extraction, such as credentials, and the default extraction directory.
- Before you initialize the `KVOpenFileArg` structure, use the macro `KVStructInit` to initialize the `KVStructHead` structure.
- pFile** A handle for the opened file. This handle is used in subsequent file extraction calls to identify the source file.

Returns

- If the file is opened, the return value is `KVERR_Success`.
- If the file is not opened, the return value is an error code and `pFile` is `NULL`.

Discussion

Call [fpCloseFile\(\)](#) to free the memory allocated by this function.

Example

```
KVOpenFileArgRec    openArg;  
  
/*Initialize the structure using KVStructInit*/  
KVStructInit(&openArg);  
openArg.extractDir = destDir;  
openArg.filePath   = srcFile;
```

```
/*Open the main file */  
if ( (error = extractInterface->fpOpenFile(pExport,&openArg,&pFile)))  
{  
    extractInterface->fpCloseFile(pFile);  
    pFile = NULL;  
}
```

Chapter 7: File Extraction API Structures

This section provides information on the structures used by the File Extraction API. These structures define the input and output parameters required to extract subfiles from a container file, and are defined in `kvextract.h`.

• KVCredential	139
• KVCredentialComponent	140
• KVExtractInterface	140
• KVExtractSubFileArg	141
• KVGetSubFileMetaArg	143
• KVMainFileInfo	144
• KVMetadataElem	145
• KVMetaName	146
• KVOpenFileArg	147
• KVOutputStream	148
• KVSubFileExtractInfo	149
• KVSubFileInfo	150
• KVSubFileMetaData	152

KVCredential

This structure contains a count of the number of credential elements, and a pointer to the first element of the array of individual elements. The structure is initialized by calling [fpOpenFile\(\)](#), and is defined in `kvextract.h`.

```
typedef struct tag_KVCredential
{
    int                itemCount;
    KVCredentialComponent *items;
}
KVCredentialRec, *KVCredential;
```

Member Descriptions

<code>itemCount</code>	The number of credentials defined for this file.
<code>items</code>	A pointer to the KVCredentialComponent structure. This structure contains the individual credential elements used to open a protected file.

KVCredentialComponent

This structure contains the value of a credential item. The structure is defined in `kvxtract.h`.

```
typedef struct tag_KVCredentialComponent
{
    KVCredKeyType    keytype;
    union
    {
        void          *pkey;
        char          *skey;
        unsigned int   ikey;
    }
    keyobj;
}
KVCredentialComponentRec, *KVCredentialComponent;
```

Member Descriptions

- keytype** The type of credential (such as a user name or password). The types are defined by the [KVCredKeyType](#) enumerated type.
- pkey** A pointer to a structure defining credentials. Reserved for future use.
- skey** A pointer to a string credential key.
- ikey** An integer credential key.

KVExtractInterface

The members of this structure are pointers to the file extraction functions described in [File Extraction API Functions, on page 129](#). When you call the [KVGetExtractInterface\(\)](#) function, this structure assigns pointers to the functions. The structure is defined in `kvxtract.h`.

```
typedef struct tag_KVExtractInterface
{
    KVStructHeader;
    int (pascal *fpOpenFile) (void *pContext, KVOpenFileArg openArg, void
**pFileHandle);
    int (pascal *fpCloseFile) (void *pFileHandle);
    int (pascal *fpGetMainFileInfo) (void *pFile, KVMainFileInfo *MainFileInfo);
    int (pascal *fpGetSubFileInfo) (void *pFile, int index, KVSubFileInfo
*subFileInfo);
    int (pascal *fpGetSubFileMetaData) (void *pFile, KVGetSubFileMetaArg metaArg,
KVSubFileMetaData *metaData);
    int (pascal *fpExtractSubFile) (void *pFile, KVExtractSubFileArg extractArg,
KVSubFileExtractInfo *extractInfo);
```

```
int (pascal *fpFreeStruct) (void *pFile, void *obj);  
}  
KVExtractInterfaceRec, *KVExtractInterface;
```

Member Descriptions

The member functions are described in [File Extraction API Functions, on page 129](#).

Discussion

Before you initialize a File Extraction structure, use the `KVStructInit` macro to initialize the `KVStructHead` structure. This process sets the revision number of the File Extraction API and supports binary compatibility with future releases.

KVExtractSubFileArg

This structure defines the input parameters required to extract a subfile. See [fpExtractSubFile\(\), on page 130](#). The structure is defined in `kvextract.h`.

```
typedef struct tag_KVExtractSubFileArg  
{  
    KVStructHeader;  
    int            index;  
    KVCharSet      srcCharset;  
    KVCharSet      trgCharset;  
    int            isMSBLSB;  
    DWORD          extractionFlag;  
    char           *filePath;  
    char           *extractDir;  
    KVOutputStream *stream;  
}  
KVExtractContainerSubFileArgRec, *KVExtractContainerSubFileArg;
```

Member Descriptions

<code>KVStructHeader</code>	The KeyView version of the structure. See KVStructHead, on page 196 .
<code>index</code>	The index number of the subfile to be extracted.
<code>srcCharset</code>	Specifies the source character set of the subfile when the file format's reader cannot determine the character set. The character sets are enumerated in <code>KVCharSet</code> of <code>kvtypes.h</code> . See Discussion, on page 143 .
<code>trgCharset</code>	If the file type is <code>KVFileType_Main</code> , this is the target character set of the extracted file. Otherwise, this is ignored. The character sets are enumerated in <code>KVCharSet</code> in <code>kvtypes.h</code> . See Discussion, on page 143 .

<code>isMSBLSB</code>	This flag indicates whether the byte order for Unicode text is Big Endian (MSBLSB) or Little Endian (LSBMSB).
<code>extractionFlag</code>	<p>A bitwise flag that defines additional parameters for file extraction. The following flags are available:</p> <ul style="list-style-type: none">• <code>KVExtractionFlag_CreateDir</code> This flag indicates whether the directory structure of a subfile should be created. If you set this flag, the path defined in <code>filePath</code> is created if it does not already exist. If you do not set this flag, the path is not created, and the function returns <code>FALSE</code>.• <code>KVExtractionFlag_Overwrite</code> If you set this flag, and the file being extracted has the same name as a file in the target path, the file in the target path is overwritten without warning. If you do not set this flag, and a subfile has the same name as a file in the target path, the error <code>KVError_OutputFileExists</code> is generated.• <code>KVExtractionFlag_ExcludeMailHeader</code> If you set this flag, header information (To, From, Sent, and so on) in a mail file is not included in the extracted data. If you do not set this flag, the extracted data contains header information and the message's body text. See Exclude Metadata from the Extracted Text File, on page 61.• <code>KVExtractionFlag_GetFormattedBody</code> If you set this flag, the formatted version of the message body (HTML or RTF) is extracted from mail files when possible. If neither an HTML nor RTF version of the message body exists in the mail file, it is extracted as plain text. If you do not set this flag, the message body is extracted as plain text when possible. <div>NOTE: When an HTML or RTF message body is extracted, the message's mail headers (such as "From," "To," and "Subject,") are extracted, saved in the same format, and added to the beginning of the subfile. This applies to PST (MAPI-based reader), MSG, and NSF files only.</div> <ul style="list-style-type: none">• <code>KVExtractionFlag_SaveAsMSG</code> If you set this flag, the mail message is extracted as an MSG file, including all of its attachments. If you do not set this flag, the mail message is extracted as text. This applies to PST files on Windows only. <div>NOTE: In file mode, when the application sets this flag in <code>fpExtractSubFile()</code>, it must also check the <code>KVSubFileExtractInfo</code> structure's <code>filePath</code> parameter to verify the file name used for extraction.</div>
<code>filePath</code>	A pointer to the suggested path or file name to which the subfile is extracted. This can be a file name, partial path, or full path. You can use this in conjunction with <code>extractDir</code> to create the full output path. See Discussion, on the next page .
<code>extractDir</code>	A pointer to the directory to which subfiles are extracted. This directory must exist. If you set this flag, the path specified in <code>KVOpenFileArg->extractDir</code> is ignored. You can use this in conjunction with <code>filePath</code> to create the full output path.

`stream` A pointer to an output stream defined by [KVOutputStream](#). See [Discussion](#), [below](#).

Discussion

- If the document character set is detected and is also specified in `srcCharset`, the detected character set is overridden by the specified character set. If the source character set is *not* detected and is *not* specified, character set conversion does not occur. The [Supported Formats, on page 276](#) section lists the formats for which the source character set can be determined.
- The `KVSubFileExtractInfoFlag_CharsetConverted` flag in the [KVSubFileExtractInfo](#) structure indicates whether the character set of the subfile was converted during extraction.
- The following applies when the output is to a file:
 - If `filePath` is a valid full path, `filePath` is the output path, and the path in `extractDir` is ignored.
 - If `filePath` is a file name or partial path, the target directory specified in either `KVExtractSubFileArg->extractDir` or `KVOpenFileArg->extractDir` is used to create the full path. See [KVOpenFileArg, on page 147](#).
 - If `filePath` is a full path or partial path, and `createDir` is `TRUE`, the directory is created if it does not already exist.
 - If `filePath` is not specified, a default name and the target directory specified in either `KVExtractSubFileArg->extractDir` or `KVOpenFileArg->extractDir` are used to create a full path.
 - If both `filePath` and `extractDir` are not specified or are invalid, an error is returned.
 - If `filePath` is valid, but `extractDir` is not valid, an error is returned.
- The following applies when the output is to a stream:
 - Set `filePath` and `extractDir` to `NULL`.
 - The file format (`docInfo`) and extraction file path (`filePath`) are not returned in [KVSubFileExtractInfo](#).
 - The `KVExtractionFlag_CreateDir` and `KVExtractionFlag_Overwrite` flags are ignored.

KVGetSubFileMetaArg

This structure defines the metadata tags whose values are retrieved by [fpGetSubFileMetaData\(\)](#). This structure is defined in `kvxtract.h`.

```
typedef struct tag_KVGetSubFileMetaArg
{
    KVStructHeader;
    int             index;
    int             metaNameCount;
    KVMetaName      *metaNameArray;
    KVCharSet       srcCharset;
    KVCharSet       trgCharset;
    int             isMSBLSB;
```

```
}  
KVGetSubFileMetaArgRec, *KVGetSubFileMetaArg;
```

Member Descriptions

KVStructHeader	The KeyView version of the structure. See KVStructHead , on page 196.
index	The index number of the subfile for which metadata is extracted.
metaNameCount	The number of metadata fields to be extracted.
metaNameArray	A pointer to the KVMetaName structure that contains an array of metadata tags whose values are retrieved.
srcCharset	Specifies the source character set of the metadata when the format's reader cannot determine the character set. The character sets are enumerated in KVCharSet of kvtypes.h. See Discussion , below.
trgCharset	The target character set of the extracted metadata. The character sets are enumerated in KVCharSet in kvtypes.h.
isMSBLSB	This flag indicates whether the byte order for Unicode text is Big Endian (MSBLSB) or Little Endian (LSBMSB).

Discussion

- If the character set is detected and is also specified in `srcCharset`, the detected character set is overridden by the specified character set. If the source character set is *not* detected and is *not* specified, character set conversion does not occur. The section [Supported Formats](#), on page 276 lists the formats for which the source character set can be determined.
- To retrieve a predefined list of metadata, pass 0 for `metaNameCount` and NULL for `metaNameArray`. The metadata in [Extract Mail Metadata](#), on page 54 is extracted.

KVMainFileInfo

This structure contains information about a main file that is open for extraction. It is initialized by calling [fpGetMainFileInfo\(\)](#). This structure is defined in `kvextract.h`.

```
typedef struct tag_KVMainFileInfo  
{  
    KVStructHeader;  
    int          numSubFiles;  
    ADDOCINFO    docInfo;  
    KVCharSet     charset;  
    int          isMSBLSB;  
    unsigned long infoFlag;  
}  
KVMainFileInfoRec, *KVMainFileInfo;
```

Member Descriptions

KVStructHeader	The KeyView version of the structure. See KVStructHead , on page 196.
numSubFiles	The number of subfiles in the main file.
docInfo	The file's major format (such as Microsoft Word or Corel Presentation), as defined by the structure ADDDOCINFO . See ADDDOCINFO , on page 192.
charset	The character set of the main file.
isMSBLSB	This flag indicates whether the byte order for Unicode text is Big Endian (MSBLSB) or Little Endian (LSBMSB).
infoFlag	<p>A bitwise flag that provides additional information about the main file. The following flag is available:</p> <p>KVMainFileInfoFlag_HasContent—The main file contains text that can be converted. Below are some examples of how this flag is used:</p> <p>For an MSG file without attachments, <code>numSubFiles</code> is 1 (message body text), and this flag is <code>FALSE</code> because the MSG file itself does not contain text.</p> <p>For a Zip file with three files, <code>numSubFiles</code> is 3, and this flag is <code>FALSE</code> because a Zip file does not contain text.</p> <p>For a Microsoft Word file with an embedded OLE object, <code>numSubFiles</code> is 1 (OLE object), and this flag is <code>TRUE</code> (Word file contains text to be converted).</p>

Discussion

- If `numSubFiles` is non-zero, get information on the subfile by calling [fpGetSubFileInfo\(\)](#), and then extract the subfiles by using [fpExtractSubFile\(\)](#).
- If `numSubFiles` is 0, the file does not contain subfiles and does not need to be extracted further. If the `KVMainInfoFlag_HasContent` flag is set, the file contains body text and can be passed directly to the conversion functions. See [HTML Export API Functions](#), on page 154.
- If `openFlag` is set to `KVOpenFileFlag_CreateRootNode` in the call to `fpOpenFile()`, `numSubFiles` also includes the root object (index 0) which is created by KeyView for reconstructing the file's hierarchy. See [KVOpenFileArg](#), on page 147.

KVMetadataElem

This structure contains metadata field values extracted from a mail file. This structure is defined in `kvtypes.h`.

```
typedef struct tag_KVMetadataElem
{
    int            isValid;
    int            dataID;
```

```
KVMetadataType    dataType;  
char*             strType;  
void*             data;  
int               dataSize;  
}  
KVMetadataElem;
```

Member Descriptions

isValid Specifies whether the metadata returned from the API is valid data.

dataID The integer name of the extracted metadata field.

dataType The data type of the metadata field. The types are defined in [KVMetadataType](#) in `kvtypes.h`.

strType A pointer to the string name of the metadata field.

data The contents of the metadata field.

If the type member is `KVMetadata_Int4` or `KVMetadata_Bool`, this member contains the actual value. Otherwise, this member is a pointer to the actual value.

`KVMetadata_DateTime` points to an 8-byte value.

`KVMetadata_String` and `KVMetadata_Unicode` point to the beginning of the string that contains the text. The strings are NULL terminated.

`KVMetadata_Binary` points to the first element of a byte array.

dataSize The byte count of data when the type is `KVMetadata_Binary`, `KVMetadata_Unicode`, or `KVMetadata_String`.

KVMetaName

This structure defines the names of the metadata fields to be extracted from a mail file. This structure is defined in `kvextract.h`.

```
typedef struct tag_KVMetaName  
{  
    KVMetaNameType    type;  
    union  
    {  
        void          *pname;  
        int            iname;  
        char           *sname;  
    }name;  
}  
KVMetaNameRec, *KVMetaName;
```

Member Descriptions

type The type of metadata name (such as integer or string). The types are defined by the [KVMetaNameType](#) enumerated type.

NOTE:
MAPI property names are of type integer.

pname A pointer to a structure defining the metadata fields to be retrieved.

iname The name of a metadata field of type integer.

sname A pointer to the name of a metadata field of type string.

Discussion

If you specify the MAPI tag name (for example, `PR_CONVERSATION_TOPIC`), you must include the `mapitags.h` and `mapidefs.h` Windows header files, in which `PR_CONVERSATION_TOPIC` is defined as `0x0070001e`.

KVOpenFileArg

This structure defines the input arguments necessary to open a file for extraction. It is initialized by calling [fpOpenFile\(\)](#). This structure is defined in `kvextract.h`.

```
typedef struct tag_KVOpenFileArg
{
    KVStructHeader;
    KVCredential    cred;
    KVInputStream    *stream;
    char             *filePath;
    char             *extractDir;
    DWORD            openFlag;
    DWORD            reserved;
    void             *pReserved;
}
KVOpenFileArgRec, *KVOpenFileArg;
```

Member Descriptions

KVStructHeader The KeyView version of the structure. See [KVStructHead](#), on page 196.

cred The credentials required to open a protected PST or NSF file. This is a pointer to the [KVCredential](#) structure. Your application can define multiple credentials to this member for multiple formats.

stream A pointer to the developer-assigned instance of `KVInputStream`. The

	<p>KVInputStream structure defines the input stream that contains the source. See KVInputStream, on page 193.</p> <p>If you are using a file as input, this is NULL.</p>
filePath	<p>A pointer to the full file path to the source file.</p> <p>If you are using a stream as input, this is NULL.</p>
extractDir	<p>A pointer to the default directory to which subfiles are extracted. This directory must exist.</p> <p>You can use this in conjunction with KVExtractSubFileArg->filePath to create the full output path. See KVExtractSubFileArg, on page 141.</p>
openFlag	<p>A bitwise flag that defines additional parameters for opening the file. The following flag is available:</p> <p>KVOpenFileFlag_CreateRootNode—If you set this flag, KeyView creates a root object when extracting this file's subfiles. This root node does not have a parent and is at the highest level of the file's tree structure. It is used internally to provide a reference point from which all other child nodes are determined, and the file's hierarchy is created.</p> <p>If you want to maintain the file's hierarchy when you extract subfiles from a container, you must set this flag. See Recreate a File's Hierarchy, on page 53 for more information.</p> <p>The root node has an index of zero. Although not all container formats require an artificial root node, the root is created for all container formats regardless of whether the file itself contains a root directory or file.</p>
reserved	Reserved for future use. It must be NULL.
pReserved	Reserved for future use. It must be NULL.

KVOutputStream

This structure defines an output stream for the extracted subfile.

```
typedef struct tag_OutputStream
{
    void *pOutputStreamPrivateData;
    BOOL (pascal *fpCreate)(struct tag_OutputStream *,TCHAR *);
    UINT (pascal *fpWrite) (struct tag_OutputStream *, BYTE *, UINT);
    BOOL (pascal *fpSeek) (struct tag_OutputStream *, long, int);
    long (pascal *fpTell) (struct tag_OutputStream *);
    BOOL (pascal *fpClose) (struct tag_OutputStream *);
}
KVOutputStream;
```

Member Descriptions

All member functions are equivalent to their counterparts in the ANSI standard library.

KVSubFileExtractInfo

This structure contains information about an extracted subfile. It is initialized by calling [fpExtractSubFile\(\)](#). This structure is defined in `kvextract.h`.

```
typedef struct tag_KVSubFileExtractInfo
{
    KVStructHeader;
    char          *filePath;
    char          *fileName;
    unsigned long  infoFlag;
    ADDOCINFO     docInfo;
}
KVSubFileExtractInfoRec, *KVSubFileExtractInfo;
```

Member Descriptions

<code>KVStructHeader</code>	The KeyView version of the structure. See KVStructHead , on page 196.
<code>filePath</code>	<p>The full path to which the subfile was extracted.</p> <p>If the subfile is embedded in the main file as a link, this is the external path to the subfile.</p> <p>If you output the data to a stream, the extraction path is not returned.</p>
<code>fileName</code>	<p>The original path, file name, or path and file name of the subfile.</p> <p>If the subfile is embedded in the main file as a link, this is the external path to the subfile.</p>
<code>infoFlag</code>	<p>A bitwise flag that provides additional information about the extracted subfile. The following flags are available:</p> <ul style="list-style-type: none">• <code>KVSubFileExtractInfoFlag_NeedsExtraction</code>—The file might contain subfiles and should be extracted further.• <code>KVSubFileExtractInfoFlag_FileCreated</code>—The file was created on disk.• <code>KVSubFileExtractInfoFlag_CharsetConverted</code>—The subfile's character set was converted.• <code>KVSubFileExtractInfoFlag_External</code>—The subfile is embedded in the main file as a link and is stored externally. For example, the subfile might be an object that was embedded in a Word document using "Link to File," or an attachment that is referenced in an MBX message. This type of file cannot be extracted. You must write code to access the subfile based on the path in the member <code>filePath</code> or <code>fileName</code>.

- `KVSubFileExtractInfoFlag_FolderCreated`—A folder was created.
- `KVSubFileExtractInfoFlag_NonFormattedBodyExtracted`—Indicates that a plain text version of the message was extracted due to an error extracting the formatted version of the message.

`docInfo` The file's major format (such as Microsoft Word or Corel Presentation), as defined by the structure `ADDOCINFO`. See [ADDOCINFO](#), on page 192.

If you output the data to a stream, the file format is not returned.

KVSubFileInfo

This structure contains information about a subfile in a container file. It is initialized by calling [fpGetSubFileInfo\(\)](#). This structure is defined in `kvxtract.h`.

```
typedef struct tag_KVSubFileInfo
{
    KVStructHeader;
    char          *subFileName;
    int           subFileType;
    long          subFileSize;
    unsigned long infoFlag;
    KVCharSet     charset;
    int           isMSBLSB;
    BYTE          fileTime[8];
    int           parentIndex;
    int           childCount;
    int           *childArray;
}
KVContainerSubFileInfoRec, *KVSubFileInfo;
```

Member Descriptions

`KVStructHeader` The KeyView version of the structure. See [KVStructHead](#), on page 196.

`subFileName` The path, file name, or path and file name of the subfile.

If the subfile is the body text of a mail file or is an embedded OLE object, KeyView provides a default file name. See [Default File Names for Extracted Subfiles](#), on page 70.

`subFileType` The subfile's position in the container file's hierarchy. The following options are available:

`KVSubFileType_Main`—The subfile is at the top level of the main file. This is the default subfile type. See [Discussion](#), on page 152.

`KVSubFileType_Attachment`—The subfile is an attachment in a file.

`KVSubFileType_OLE`—The subfile is an embedded OLE object in a compound document.

	<p>KVSubFileType_Folder—The subfile is a folder or the artificial root node (see Create a Root Node, on page 53).</p>
subFileSize	<p>The size of the subfile in bytes. This information might be useful if you do not want to extract very large files.</p> <p>This value is approximate and is the maximum size of the subfile. The subfile is usually smaller than this value when it is extracted.</p>
infoFlag	<p>A bitwise flag that provides additional information about the subfile. The following flags are available:</p> <p>KVSubFileInfoFlag_NeedsExtraction—The subfile might contain subfiles. It must be extracted further to conclusively determine whether it contains subfiles.</p> <p>KVSubFileInfoFlag_Secure—The subfile is secured and credentials (such as user name and password) are required to extract it. This flag applies to ZIP, RAR, and PDF files only.</p> <p>KVSubFileInfoFlag_SMIME—The subfile is S/MIME-encrypted and credentials are required to extract it. This applies to .eml and .pst files only.</p> <p>KVSubFileInfoFlag_External—The subfile is embedded in the main file as a link and is stored externally. For example, the subfile might be an object that was embedded in a Word document by using "Link to File," or an attachment that is referenced in an MBX message. This type of file cannot be extracted. You must write code to access the subfile based on the path in the member <code>subFileName</code>.</p> <p>KVSubFileInfoFlag_MailItem—When the subfile type is <code>KVSubFileType_Attachment</code>, this indicates that the attachment is a mail item. This flag applies to PST, MSG, and NSF files only.</p>
charset	<p>If the subfile is not an attachment, this is the character set of the subfile. If the subfile is an attachment, the character set is <code>KVCS_UNKNOWN</code>.</p>
isMSBLSB	<p>This flag indicates whether the byte order for Unicode text is Big Endian (MSBLSB) or Little Endian (LSBMSB).</p>
fileTime	<p>When the subfile is a mail message, this is the file's <code>Sent</code> time. Otherwise, it is the last modified time. The file time is not available for the following file types:</p> <ul style="list-style-type: none">• EML attachments• OLE objects in a Microsoft Office document• Embedded images
parentIndex	<p>The index number of this file's parent. For example, the index of a folder in which the subfile is stored, or the file to which the subfile is attached. If a file does not have a parent, the <code>parentIndex</code> is <code>-1</code>.</p>
childCount	<p>The number of first-level children in the subfile.</p>
childArray	<p>A pointer to an array of first-level children in the subfile.</p>

Discussion

The `KVSubFileType_Main` type applies to the following for each file format:

File format	KVSubFileType_Main applies to...
MSG and EML	The message body.
Zip files	A file inside the archive.
PST files	An item that is not an attachment, an OLE object, or a root node.
MBX files	A message in the MBX file.
NSF files	An item that is not an attachment, an OLE object, or a root node.
PDF files	An item that is not an attachment or a root node.

- If you set the `KVSubFileInfoFlag_NeedsExtraction` flag, open the subfile and extract its children. See [fpOpenFile\(\)](#), [on page 137](#) and [fpExtractSubFile\(\)](#), [on page 130](#).
- The `parentIndex` and `childArray` members provide information about the subfile's parent and children. You can use this information to recreate the file hierarchy on extraction. Because `childArray` retrieves only the first-level children in the subfile, you must call `fpGetSubFileInfo()` repeatedly until information for the leaf-node children is extracted. See [Recreate a File's Hierarchy](#), [on page 53](#).

KVSubFileMetaData

This structure contains a count of the number of metadata elements extracted from a mail file, and a pointer to the first element of the array of elements. It is initialized by calling [fpGetSubFileMetaData\(\)](#). This structure is defined in `kvxtract.h`.

```
typedef struct tag_KVSubFileMetaData
{
    KVStructHeader;
    int          nElem;
    KVMetadataElem** ppElem;
    unsigned long infoFlag;
}
KVSubFileMetaDataRec, *KVSubFileMetaData;
```

Member Descriptions

- `KVStructHeader` The KeyView version of the structure. See [KVStructHead](#), [on page 196](#).
- `nElem` The number of metadata fields contained in the array.
- `ppElem` A pointer to an array of pointers that are the memory addresses of metadata field values in the [KVMetadataElem](#) structure.

infoFlag A bitwise flag that defines additional properties of the extracted metadata. The following flag is available:

 KVSubFileMetaInfoFlag_CharsetConverted—Indicates that the metadata's character set was converted.

Chapter 8: HTML Export API Functions

This section describes the functions in the HTML Export API. These functions manage the input and output streams, and perform the document conversion. Each function appears as a function prototype followed by a description of its arguments, its return value, and discussion of its use.

• KVHTMLGetInterfaceEx()	154
• KVHTMLGetInterfaceEx2()	155
• fpConvertStream()	156
• fpFileToInputStreamCreate()	158
• fpFileToInputStreamFree()	159
• fpFileToOutputStreamCreate()	160
• fpFileToOutputStreamFree()	161
• fpGetAnchor()	162
• fpGetConvertFileList()	163
• fpGetKvErrorCode	164
• fpGetKvErrorCodeEx	164
• fpGetStreamInfo()	165
• fpGetSummaryInfo()	165
• fpInit()	167
• fpSetStyleMapping()	168
• fpShutDown()	169
• fpValidateTemplate()	169
• KVHTMLConfig()	170
• KVHTMLConvertFile()	177
• KVHTMLEndOOPSession()	179
• KVHTMLSetHighlight()	181
• KVHTMLSetStyleSheet()	182
• KVHTMLStartOOPSession()	183

KVHTMLGetInterfaceEx()

NOTE:

This function has been superseded by [KVHTMLGetInterfaceEx2\(\)](#); [KVHTMLInterfaceEx2\(\)](#) should be used instead of [KVHTMLInterfaceEx\(\)](#).

This is exported by the Export definition file. It supplies function pointers to other Export functions. When [KVHTMLGetInterfaceEx\(\)](#) is called, it assigns the function pointers in the [KVHTMLInterfaceEx](#)

structure to other functions described in this chapter. For example, `KVHTMLInterfaceEx.fpInit` is assigned to point to `KVHTMLInitEx()`.

Syntax

```
void pascal KVHTMLGetInterfaceEx (KVHTMLInterfaceEx *pInterface);
```

Arguments

`pInterface` A pointer to the structure `KVHTMLInterfaceEx`. See [KVHTMLInterfaceEx, on page 204](#).

Returns

None.

Discussion

- One of the initial steps in using the HTML Export API is to create an instance of a `KVHTMLInterfaceEx` structure and use this function to gain access to other functions.
- You can call the API functions directly. For example, you can call `KVHTMLGetSummaryInfo()` instead of using `fpGetSummaryInfo()` in `KVHTMLInterfaceEx`. However, Micro Focus recommends that you assign the function pointers in `KVHTMLInterfaceEx` to the functions for efficiency.

KVHTMLGetInterfaceEx2()

This function is exported by the Export definition file. It supplies function pointers to other Export functions. When `KVHTMLGetInterfaceEx2()` is called, it assigns the function pointers in the structure `KVHTMLInterfaceEx2` to other functions described in this chapter. For example, `KVHTMLInterfaceEx2.fpInit` is assigned to point to `KVHTMLInitEx()`.

Syntax

```
BOOL pascal KVHTMLGetInterfaceEx2 (KVHTMLInterfaceEx2 *pInterface);
```

Arguments

`pInterface` A pointer to the structure `KVHTMLInterfaceEx2`. See [KVHTMLInterfaceEx2, on page 206](#).

Returns

- If the call is successful, the return value is `TRUE`.
- If the call is unsuccessful, the return value is `FALSE`.

If the function fails, all function pointers in `pInterface` are set to `NULL`.

You must initialize `pInterface` by calling `KVStructInit` prior to passing it to `KVHTMLGetInterfaceEx2`. If you do not do this, the function fails.

Discussion

- One of the initial steps in using the HTML Export API is to create an instance of a `KVHTMLInterfaceEx2` structure and use this function to gain access to other functions.
- The API functions can be called directly. For example, you can call `KVHTMLGetSummaryInfo()` instead of using `fpGetSummaryInfo()` in `KVHTMLInterfaceEx2`. However, Micro Focus recommends that you assign the function pointers in `KVHTMLInterfaceEx2` to the functions for efficiency.
- You must initialize `KVHTMLInterfaceEx2` by calling `KVStructInit` prior to passing it to `KVHTMLGetInterfaceEx2`, otherwise `KVHTMLGetInterfaceEx2` fails.

Example

```
KVHTMLInterfaceEx2 KVHTMLInt;  
BOOL (pascal *fpGetInterfaceEx2)(KVHTMLInterfaceEx2 *);  
...  
KVStructInit(&KVHTMLInt);  
(*fpGetInterfaceEx2)(&KVHTMLInt);
```

fpConvertStream()

This function converts either a source stream or file to an output stream.

Syntax

```
BOOL pascal fpConvertStream(  
    void                *pContext,  
    void                *pCallingContext,  
    KVInputStream        *pInput,  
    KVOutputStream       *pOutput,  
    KVHTMLTemplateEx    *pTemplatesEx,  
    KVHTMLOptionsEx      *pOptionsEx,  
    KVHTMLCallbacksEx   *pCallbacksEx,  
    KVHTMLTOCOptions     *pTOCCreateOptions,  
    BOOL                bIndex,  
    KVErrCode            *pError );
```

Arguments

<code>pContext</code>	A pointer returned from <code>fpInit()</code> .
-----------------------	---

<code>pCallingContext</code>	A pointer passed back to the callback functions.
<code>pInput</code>	A pointer to the developer-assigned instance of <code>KVInputStream</code> . The <code>KVInputStream</code> structure defines the input stream that contains the source for the conversion. See KVInputStream, on page 193 .
<code>pOutput</code>	A pointer to the developer-assigned instance of <code>KVOutputStream</code> . The <code>KVOutputStream</code> structure defines the output stream to which Export writes the generated HTML. See KVOutputStream, on page 194 .
<code>pTemplatesEx</code>	<p>A pointer to the <code>KVHTMLTemplateEx</code> data structure. It defines the overall structure of the output. Individual elements within the structure define the markup written at specific points in the output stream. See KVHTMLTemplateEx, on page 217.</p> <p>If this pointer is <code>NULL</code>, the default values for the structure are used.</p>
<code>pOptionsEx</code>	<p>A pointer to the <code>KVHTMLOptionsEx</code> data structure. It defines the options that control the markup written in response to the general style and attributes (font, color, and so on) of the document. See KVHTMLOptionsEx, on page 208.</p> <p>If this pointer is <code>NULL</code>, the default values for the structure are used.</p>
<code>pCallbacksEx</code>	<p>A pointer to the <code>KVHTMLCallbacksEx</code> data structure. It is a structure of functions that Export calls for specific, user-defined purposes. See KVHTMLCallbacksEx, on page 200.</p> <p>If callbacks are not used, this can be <code>NULL</code>.</p>
<code>pTOCCreateOptions</code>	<p>A pointer to the <code>KVHTMLTOCOptions</code> data structure. It specifies whether a heading is included in the table of contents. See KVHTMLTOCOptions, on page 222.</p> <p>If this pointer is <code>NULL</code>, the default values for the structure are used.</p>
<code>bIndex</code>	<p>Set <code>bIndex</code> to <code>TRUE</code> to generate output with minimal markup and without images. Because the generated output is minimized to textual content, it is suitable for an indexing engine. If you set <code>bIndex</code> to <code>FALSE</code>, embedded images in a document are regenerated as separate files and stored in the output directory.</p> <p>You can also set this option through the bNoPictures, on page 215 member in the template files.</p>
<code>pError</code>	A pointer to an error code if the call to <code>fpConvertStream()</code> fails.

Returns

- If the call is successful, the return value is `TRUE`.
- If the call is unsuccessful, the return value is `FALSE`.

Discussion

- Only pContext, pInput, pOutput, and bIndex are required. All other pointers should be NULL when they are not set.
- If pCallbacksEx is NULL, pOptionsEx->pszDefaultOutputDirectory must be valid, except when bIndex is set to TRUE.
- This function runs in-process or out of process. See [Convert Files Out of Process, on page 29](#).
- When converting out of process, this function must be called after the call to KVHTMLStartOOPSession() and before the call to KVHTMLEndOOPSession(). See [KVHTMLStartOOPSession\(\), on page 183](#) and [KVHTMLEndOOPSession\(\), on page 179](#).
- When converting out of process, the values for the KVHTMLTemplateEx, KVHTMLOptionsEx, and KVHTMLTOCOptions structures should be set to NULL. These structures are already passed in the call to KVHTMLStartOOPSession(). See [KVHTMLStartOOPSession\(\), on page 183](#).

Example

The following sample code is from the cnv2html sample program:

```
if(!(*KVHTMLInt.fpConvertStream)(
    pKVHTML,          /* A pointer returned by fpInit() */
    NULL,             /* A pointer for callback functions */
    &Input,            /* Input stream */
    &Output,           /* Output stream */
    &HTMLTemplates,    /* Markup and related variables */
    &HTMLOptions,      /* Options */
    NULL,             /* A pointer to callback functions */
    NULL,             /* TOC options */
    FALSE,            /* Index mode */
    &error))          /* Error return value */
{
    printf("Error converting %s to HTML %d\n", argv[i - 1], error);
}
else
{
    printf("Conversion of %s to HTML completed.\n\n", argv[i - 1]);
}
```

fpFileToInputStreamCreate()

This function creates an input stream from an input file.

Syntax

```
BOOL pascal _export fpFileToInputStreamCreate(
    void          *pContext,
```

```
char          *pszFileName,  
KVInputStream *pInput);
```

Arguments

pContext A pointer returned from `fpInit()`.

pszFileName A pointer to the name of the input file to be converted.

pInput A pointer to the developer-assigned instance of `KVInputStream`. The `KVInputStream` structure defines the input stream that contains the source for the conversion. See [KVInputStream, on page 193](#).

Returns

- If the call is successful, the return value is `TRUE`.
- If this call is unsuccessful, the return value is `FALSE`. Processing is halted.

Discussion

After the conversion is complete, call `fpFileToInputStreamFree()` to free the memory allocated by this function.

Example

The following sample code is from the `cnv2html` sample program:

```
if(!(*KVHTMLInt.fpFileToInputStreamCreate)(pKVHTML, argv[i++], &Input))  
{  
    printf("Error creating input stream\n");  
    (*KVHTMLInt.fpShutDown)(pKVHTML);  
    mpFreeLibrary(hKVHTML);  
    return (5);  
}
```

fpFileToInputStreamFree()

This function frees the memory used to create an input stream.

Syntax

```
BOOL pascal _export fpFileToInputStreamFree(  
    void          *pContext,  
    KVInputStream *pInput);
```

Arguments

- pContext** A pointer returned from `fpInit()`.
- pInput** A pointer to the developer-assigned instance of `KVInputStream`. The `KVInputStream` structure defines the input stream that contains the source for the conversion. See [KVInputStream, on page 193](#).

Returns

- If the call is successful, the return value is `TRUE`.
- If this call is unsuccessful, the return value is `FALSE`. Processing is halted.

Discussion

After the conversion is complete, call this function to free the memory allocated by `fpFileToInputStreamCreate()`.

fpFileToOutputStreamCreate()

This function creates an output stream from an output file.

Syntax

```
BOOL pascal _export fpFileToOutputStreamCreate(  
    void                *pContext,  
    char                *pszFileName,  
    KVOutputStream      *pOutput );
```

Arguments

- pContext** A pointer returned from `fpInit()`.
- pszFileName** A pointer to the name of the output file to create.
- pOutput** A pointer to the developer-assigned instance of `KVOutputStream`. The `KVOutputStream` structure defines the output stream to which Export writes the generated HTML. See [KVOutputStream, on page 194](#).

Returns

- If the call is successful, the return value is `TRUE`.
- If this call is unsuccessful, the return value is `FALSE`. Processing is halted.

Discussion

After the conversion is complete, call `fpFileToOutputStreamFree()` to free the memory allocated by this function.

Example

The following sample code is from the `cnv2html` sample program:

```
if (!(*KVHTMLInt.fpFileToOutputStreamCreate)(pKVHTML, argv[i], &Output))
{
    printf("Error creating output stream\n");
    (*KVHTMLInt.fpFileToInputStreamFree)(pKVHTML, &Input);
    (*KVHTMLInt.fpShutDown)(pKVHTML);
    mpFreeLibrary(hKVHTML);
    return 6;
}
```

fpFileToOutputStreamFree()

This function frees the memory used to create the output stream.

Syntax

```
BOOL pascal _export fpFileToOutputStreamFree(
    void                *pContext,
    KVOutputStream       *pOutput );
```

Arguments

pContext A pointer returned from `fpInit()`.

pOutput A pointer to the developer-assigned instance of `KVOutputStream`. The `KVOutputStream` structure defines the output stream to which Export writes the generated HTML. See [KVOutputStream, on page 194](#).

Returns

- If the call is successful, the return value is `TRUE`.
- If this call is unsuccessful, the return value is `FALSE`. Processing is halted.

Discussion

After the conversion is complete, call this function to free the memory allocated by `fpFileToOutputStreamCreate()`.

fpGetAnchor()

This function gets the file name automatically generated by Export and used for external graphics referenced with `` tags and for heading-level table of contents entries.

Syntax

```
BOOL pascal fpGetAnchor(  
    void *pCallingContext,  
    KVHTMLAnchorTypeEx eAnchorTypeEx,  
    KVXMLAnchorType eAnchorType,  
    char *pszAnchor,  
    int cbAnchorMax,  
    BYTE *pHTML,  
    UINT cbHTML);
```

Arguments

<code>pCallingContext</code>	A pointer passed back to the callback functions.
<code>eAnchorTypeEx</code>	The graphic or block anchor type for the output stream. It must be one of the enumerated types defined in <code>KVHTMLAnchorTypeEx</code> . See KVHTMLAnchorTypeEx , on page 234.
<code>pszAnchor</code>	A pointer to the location in which the new anchor is stored.
<code>cbAnchorMax</code>	The maximum number of bytes to place in <code>pszAnchor</code> .
<code>pHTML</code>	A pointer to either the markup defining the contents of the table of contents entry, a pointer to the external graphic name, or <code>NULL</code> .
<code>cbHTML</code>	The number of valid bytes in <code>pHTML</code> .

Returns

- If the call is successful, the return value is `TRUE`.
- If this call is unsuccessful, the return value is `FALSE`. Processing is halted.

Discussion

- `pszAnchor` must be assigned. It might be derived from the `cbAnchorMax`, `pcHTML`, and `cbHTML` values that are also provided.
- `pcHTML` can be `NULL` if the graphic is an internal part of the document.
- This function is exposed so that it can be called from the `GetAnchor()` callback function to obtain default behavior for anchor types the callback is not set to handle.

fpGetConvertFileList()

This function gets the list of files automatically converted to HTML during a call to `fpConvertStream()` or `KVHTMLConvertFile()`.

Syntax

```
char ** pascal _export fpGetConvertFileList(  
    void    *pContext,  
    int     *pnSize );
```

Arguments

<code>pContext</code>	A pointer returned from <code>fpInit()</code> .
<code>pnSize</code>	A pointer to the number of files generated by the conversion.

Returns

If no files are converted, the return value is a `NULL` pointer. Otherwise, the return value is a pointer to an array of strings that provides the available path information for each converted file.

Discussion

- The array of file path information includes all externally generated files, including graphic files. Note that the main output file is not included in the array, nor in the count of the number of files converted.
- The memory used by the array of file path information is freed by the API.
- The array is not valid after a call to `fpShutDown()`.
- This function runs in-process or out of process. See [Convert Files Out of Process, on page 29](#).
- When converting out of process, this function must be called after the call to `KVHTMLStartOOPSession()` and before the call to `KVHTMLEndOOPSession()`. See [KVHTMLStartOOPSession\(\), on page 183](#) and [KVHTMLEndOOPSession\(\), on page 179](#).

fpGetKvErrorCode

This function gets an extended error code defined in `KVErrorCode`. If a KeyView HTML Export function fails, you can call `fpGetKvErrorCode()` to find extra information on the failure.

Syntax

```
KVErrorCode pascal fpGetKvErrorCode (  
    void          *pContext );
```

Arguments

`pContext` A pointer returned from `fpInit()`. See [fpInit\(\)](#), on page 167.

Returns

The current error code.

Discussion

If there has not been a failure, this function returns `KVERR_Success`.

fpGetKvErrorCodeEx

This function gets an extended error code defined in `KVErrorCodeEx`. It is called to provide additional information when `fpGetKvErrorCode()` returns the error `KVERR_General`.

Syntax

```
KVErrorCodeEx pascal fpGetKvErrorCodeEx (  
    void          *pContext );
```

Arguments

`pContext` A pointer returned from `fpInit()`. See [fpInit\(\)](#), on page 167.

Returns

The current extended error code.

fpGetStreamInfo()

This function extracts file format and character set information from the source document.

Syntax

```
BOOL pascal _export fpGetStreamInfo (
    void          *pContext,
    KVInputStream  *pInput,
    KVStreamInfo   *pStreamInfo );
```

Arguments

- | | |
|--------------------|---|
| pContext | A pointer returned from <code>fpInit()</code> . |
| pInput | A pointer to the developer-assigned instance of <code>KVInputStream</code> . The <code>KVInputStream</code> structure defines the input stream that contains the source for the conversion. See KVInputStream, on page 193 . |
| pStreamInfo | A pointer to the developer-assigned instance of <code>KVStreamInfo</code> . The <code>KVStreamInfo</code> structure defines the input stream document type and character set. See KVStreamInfo, on page 195 .

You can examine the fields in the structure to determine the appropriate template to use based on the document type. |

Returns

- If the call is successful, the return value is `TRUE`.
- If this call is unsuccessful, the return value is `FALSE`.

fpGetSummaryInfo()

This function extracts all metadata from the input stream. See [Extract Metadata, on page 73](#) for more information.

Syntax

```
BOOL pascal _export fpGetSummaryInfo(
    void          *pContext,
    KVInputStream  *pInput,
    KVSummaryInfoEx *pSummary,
    BOOL          bFree );
```

Arguments

- pContext** A pointer returned from `fpInit()`.
- pInput** A pointer to the developer-assigned instance of `KVInputStream`. The `KVInputStream` structure points to the input stream that contains the source for the conversion. See [KVInputStream, on page 193](#).
- pSummary** A pointer to the developer-assigned instance of `KVSummaryInfoEx`.
In this structure, `nElem` provides a count of the number of metadata elements, and `pElem` points to the first element of the array of individual elements as defined by the structure `KVSumInfoElemEx`. See [KVSummaryInfoEx, on page 198](#).
- bFree** A flag to free or fill the memory allocated to the document metadata.

Returns

- If the call is successful, the return value is `TRUE`. When the document does *not* contain metadata, but the document reader can extract metadata from the specified format, this function returns `TRUE` with `nElem` set to 0.
- If this call is unsuccessful, the return value is `FALSE`. This function returns `FALSE` when the document reader does not support metadata extraction for the specified format, or there is an error in extraction. The section [Supported Formats, on page 276](#) lists the file formats for which metadata can be determined.

Discussion

- For metadata to be extracted by Export, metadata must be defined in the source document, and the document reader must be able to extract metadata for the file format. [Supported Formats, on page 276](#) lists the file formats for which metadata can be determined. Export does not generate metadata automatically from the document contents.
- This function runs in-process or out of process. See [Convert Files Out of Process, on page 29](#).
- You can call this function at any time after the call to `fpInit()`.
- When converting out of process, this function must be called after the call to `KVHTMLStartOOPSession()` and before the call to `KVHTMLEndOOPSession()`. See [KVHTMLStartOOPSession\(\), on page 183](#) and [KVHTMLEndOOPSession\(\), on page 179](#).
- Call this function with `bFree` set to `FALSE` to return an array of `KVSummaryInfoEx` structures, each containing an element of available document metadata.
- After processing the information in the structure, call this function with `bFree` set to `TRUE` to free the memory allocated to the document metadata.

fpInit()

This function initializes an Export session. Its return value, `pContext`, is passed as the first parameter to the File Extraction interface and all other Export functions.

Syntax

```
void* pascal _export fpInit(  
    KVMemoryStream    *pMemAllocator,  
    char               *pszKeyViewDir,  
    char               *pszDataFile,  
    KVErrorCode        *pError,  
    DWORD              dWord);
```

Arguments

<code>pMemAllocator</code>	A pointer to a developer-defined memory allocator. If <code>NULL</code> is passed, the default C run-time memory allocation is used.
<code>pszKeyViewDir</code>	A pointer to the directory where the Export components are located. This is normally the directory <code>install\OS\bin</code> , where <code>install</code> is the path name of the Export installation directory and <code>OS</code> is the name of the operating system.
<code>pszDataFile</code>	<p>A pointer to the directory and file name of the Export data file, <code>formats_e.ini</code>. This file determines whether a format is supported. If a format does not exist in this file, the conversion fails.</p> <p>The <code>formats_e.ini</code> file is normally stored in the directory <code>install\OS\bin</code>, where <code>install</code> is the path name of the Export installation directory and <code>OS</code> is the name of the operating system. See File Format Detection, on page 362 for more information.</p>
<code>pError</code>	A pointer to an error code defined in <code>KVErrorCode</code> or <code>KVErrorCodeEx</code> in <code>kvtypes.h</code> . See KVErrorCode, on page 228 and KVErrorCodeEx, on page 230 .
<code>dWord</code>	Reserved. Must be 0.

Returns

- If the call is successful, the return value is a pointer passed to all other functions.
- If the call is unsuccessful, the return value is a `NULL` pointer.

Discussion

- If `pszKeyViewDir` is `NULL`, the required components cannot be found. Ensure that it is valid.
- If this function returns `NULL`, check `stderr` for the KeyView installation error messages, "KeyView

Export SDK License Key has Expired" and "KeyView Export SDK License Key is Invalid", and pass them to your application. See the *Export SDK Installation Instructions* for more information on the KeyView license feature.

- To ensure multithreaded conversions are thread-safe, you must create a unique context pointer for every thread by calling `fpInit()`. In addition, threads must not share context pointers, and the same context pointer must be used for all API calls in the same thread. Creating a context pointer for every thread does not affect performance because the context pointer uses minimal resources.
- When the conversion context is no longer required, it should be terminated by calling `fpShutdown()`. See [fpShutdown\(\)](#), on the next page.

Example

The following sample code is from the `cnv2html` sample program:

```
pKVHTML = (*KVHTMLInt.fpInit)(NULL, ".", NULL, &error, 0);
if(!pKVHTML)
{
    printf("Error initializing KVHTML: %d\n", error);
    mpFreeLibrary(hKVHTML);
    return 4;
}
```

fpSetStyleMappingO

This function is used to set the mapping for user-defined styles. Export does not make a distinction between paragraph styles or character styles, but operates under the assumption that each style has a unique name.

Syntax

```
BOOL pascal _export fpSetStyleMapping(
    void      *pContext,
    KVStyle    *pStyles,
    int        iStyles,
    BOOL       bCopy);
```

Arguments

- | | |
|-----------------------|---|
| <code>pContext</code> | A pointer returned from <code>fpInit()</code> . |
| <code>pStyles</code> | A pointer to the developer-assigned instance of <code>KVStyle</code> . See KVStyle , on page 197. The <code>KVStyle</code> structure defines the elements of a custom style. |
| <code>iStyles</code> | The number of elements in the <code>pStyles</code> array. |
| <code>bCopy</code> | If Export is to allocate memory to copy the <code>pStyles</code> array, set this to <code>TRUE</code> . If <code>pStyles</code> remains valid throughout the conversion process, set this to <code>FALSE</code> . |

Returns

- If the call is successful, the return value is `TRUE`.
- If this call is unsuccessful, the return value is `FALSE`.

Discussion

- Paragraph styles are presently implemented only for documents in Microsoft Word, RTF, Folio Flat files, WordPro, and WordPerfect 6.x.
- This function runs in-process or out of process. See [Convert Files Out of Process, on page 29](#).
- When converting out of process, this function must be called after the call to `KVHTMLStartOOPSession()` and before the call to `KVHTMLEndOOPSession()`. See [KVHTMLStartOOPSession\(\), on page 183](#) and [KVHTMLEndOOPSession\(\), on page 179](#).
- After this API function is called, the styles are valid until `fpShutDown()` is called, or until this function is called again with a new style or `NULL`.

fpShutDown()

This function terminates an Export session that was initialized by `fpInit()`, and frees allocated system resources. It is called when the conversion context is no longer required.

Syntax

```
void pascal _export fpShutDown(KVHTMLContext *pContext);
```

Arguments

<code>pContext</code>	A pointer returned from <code>fpInit()</code> .
-----------------------	---

Returns

None.

Discussion

After this function is called, the `pContext` pointer must not be passed to any HTML Export API.

fpValidateTemplate()

This function is used to ensure that the markup in the structures is valid. It is currently not implemented.

KVHTMLConfig()

This function is called directly and provides a way to configure options prior to document conversion. Currently, the function is used for the following configurations:

- **Enable PDF conversion to JPEG**
Enable the graphic-based PDF reader `kppdfldr` to convert PDF documents to JPEG files.
- **Configure PDF bookmarks**
Specify whether bookmarks in a PDF file are used to create a table of contents in the HTML output.
- **Configure rotated text**
Specify whether rotated text is displayed in its original position or at the bottom of the page. Currently, this option applies only to PDF files.
- **Designate temporary directory**
Specify a directory in which temporary files created during the conversion process are stored.

NOTE: On Windows systems, there is a 64 K size limit to the temporary directory. When the limit is reached, you must either create a new directory or delete the contents of the existing directory; otherwise, you might receive an error message.
- **Configure XML conversion**
Specify the elements and attributes extracted from an XML document based on a file's document type.
- **Enable PDF logical reading order**
Convert paragraphs in PDF files in the order in which they appear on the PDF page and with left-to-right or right-to-left paragraph direction. See [Convert PDF Files to a Logical Reading Order, on page 92](#).
- **Configure PDF soft hyphens**
Specify whether soft hyphens in a PDF file are removed from the HTML output. See [Control Hyphenation, on page 98](#).
- **Enable revision marks**
Convert text and graphics that were deleted from a document with revision tracking enabled and include revision information in the HTML output. See [Include Revision Information, on page 86](#).
- **Enable empty image tags**
Prevent graphics from being converted and generate image tags with empty `src` attributes. This makes the conversion faster, but, because placeholders are generated for the graphics, maintains the text flow of the original document. This is similar to the `bNoPictures` parameter; however, `bNoPictures` does not generate an image tag. See [bNoPictures, on page 215](#).
- **Toggle hidden data output from Microsoft Word, Excel, and PowerPoint documents**
Show or hide information from hidden sources such as comments or slides. See [Show Hidden Data, on page 108](#).
- **Enable a PDF invisible text toggle button**

Enable a JavaScript button that toggles the display of invisible text and regular content in exported PDF documents. [Toggle Invisible Text, on page 96](#).

- **Specify opacity of invisible text in PDFs**

Specify the opacity of invisible text in exported PDF documents, from 0 (invisible) to 100 (fully visible). See [Specify Opacity of Invisible Text, on page 97](#).

- **Protected file password**

Specify the password to use to open a password-protected file for export.

- **Specify output character set for summary information**

Specify the output character set for the document's metadata, when using `fpGetSummaryInfo()`.

- **Enable tabbed spreadsheet view**

Enables a tabbed navigation view for spreadsheets.

Syntax

```
KVErrorCode pascal KVHTMLConfig(  
    void      *pContext,  
    int       nType,  
    int       nValue,  
    void      *p );
```

Arguments

pContext A pointer returned from `fpInit()`.

nType The configuration flag. This is a symbolic constant defined in `kvtypes.h`. The available options are described in [Configuration Flags for KVHTMLConfig\(\), on the next page](#).

nValue The integer value defined for the flags above. This is `TRUE` or `FALSE` for all flags except:

- `KVCFG_LOGICALPDF`—`nValue` is one of the paragraph direction options defined in the `LPDF_DIRECTION` enumerated type in `kvtypes.h`. See [LPDF_DIRECTION, on page 243](#).
- `KVCFG_SETTEMPDIRECTORY`—`nValue` is not set.
- `KVCFG_SETXMLCONFIGINFO`—`nValue` is not set.
- `KVCFG_SETINVISIBLETOGGLE`—`nValue` is not set.
- `KVCFG_SETINVISIBLETOPACITY`—`nValue` is an integer that specifies text opacity, from 0 (invisible) to 100 (fully visible).
- `KVCFG_SETMETADATACHARSET`—`nValue` is a character set enumerated in `KVCharSet` of `kvtypes.h`. See [Convert Character Sets, on page 76](#).

p The data for the configuration flag. This is `NULL` for all flags except:

- `KVCFG_SETTEMPDIRECTORY`—This is a pointer to a path to the directory where temporary files are stored.
- `KVCFG_SETXMLCONFIGINFO`—This is a pointer to the `KVXConfigInfo` structure. See

[KVXConfigInfo](#), on page 199.

- **KVCFG_INCLREVISIONMARK**—This is a pointer to the `KVRevisionMark` structure. See [KVRevisionMark](#), on page 223.
- **KVCFG_SETINVISTEXTTOGGLE**—This is a null-terminated string that determines the toggle button name.
- **KVCFG_SETPASSWORD**—This is the source file password.

Returns

The return value is one of the error codes defined in `KVErrorCode` in `kvtypes.h`.

Discussion

- You must call this function after the call to `fpInit()` and before the call to `fpConvertStream()` or `KVHTMLConvertFile()`.
- This function runs in-process or out of process. See [Convert Files Out of Process](#), on page 29.
- When converting out of process, you must call this function after the call to `KVHTMLStartOOPSession()` and before the call to `KVHTMLEndOOPSession()`. See [KVHTMLStartOOPSession\(\)](#), on page 183 and [KVHTMLEndOOPSession\(\)](#), on page 179.
- The configuration flags are described in [Configuration Flags for KVHTMLConfig\(\)](#), below.

Configuration Flags for KVHTMLConfig()

Flag	Description
<code>KVCFG_SETHIFIPDF</code>	<p>This flag enables the graphic-based PDF reader <code>kppdfldr</code> to convert PDF documents. See Convert PDF Files to Raster Images, on page 92.</p> <p>By default, Export uses the basic PDF reader, <code>pdfsr</code>, to convert PDF</p>
<code>KVCFG_SETMETADATACHARSET</code>	<p>This flag enables you to specify the output character set for metadata when using <code>fpGetSummaryInfo()</code>. <code>nValue</code> is a character set enumerated in <code>KVCharSet</code> of <code>kvtypes.h</code>. See Convert Character Sets, on page 76. You should call this function before <code>fpGetSummaryInfo()</code>.</p>
<code>KVCFG_SUPPRESSTOCPRINTIMAGE</code>	<p>If you set <code>KVCFG_SUPPRESSTOCPRINTIMAGE</code>, bookmarks in a PDF file are not used to generate a table of contents in the HTML output. By default, the table of contents is generated from bookmarks within the PDF file. See Generate a Table of Contents from PDF Bookmarks, on page 95.</p>
<code>KVCFG_SETTEXTROTATE</code>	<p>If you set <code>KVCFG_SETTEXTROTATE</code>, rotated text in a file is displayed at 0 degrees at the bottom of the page on which it appears. The page is enlarged to accommodate the text.</p> <p>By default, rotated text in a file is displayed in its original position, at the original font size, and at 0 degrees rotation. Because the text is the original size, but might be displayed in a smaller space, the text might</p>

Configuration Flags for KVHTMLConfig(), continued

Flag	Description
	<p>overlap adjacent text in the HTML output. You use the <code>KVCFG_SETTEXTROTATE</code> option to avoid this problem. See Convert Rotated Text, on page 97.</p> <p>HTML markup does not support text rotation.</p>
<code>KVCFG_SETTEMPDIRECTORY</code>	<p>This flag enables you to specify the directory in which temporary files created during conversion processes are stored. By default, the system temporary directory is used.</p> <p>To define a directory for temporary files generated during an out-of-process conversion, set the <code>tempfilepath</code> parameter in the <code>formats_e.ini</code> file. Convert Files Out of Process, on page 29.</p> <p>On Windows systems, there is a 64 K size limit to the temporary directory. When the limit is reached, you must either create a new directory or delete the contents of the existing directory; otherwise, you might receive an error message.</p>
<code>KVCFG_SETXMLCONFIGINFO</code>	<p>This flag enables you to define which elements and attributes are extracted from XML documents with a specified format ID or root element. You can use this to override the default settings for the supported XML formats (see Convert XML Files, on page 104), or to define settings for custom XML document types.</p> <p>The settings are defined in the <code>KVXConfigInfo</code> structure (see KVXConfigInfo, on page 199). To set custom settings for more than one document type, call the <code>KVHTMLConfig()</code> function once for each type.</p> <p>You can also modify element extraction settings by using the <code>kvxconfig.ini</code> file. See Configure Element Extraction for XML Documents, on page 104.</p>
<code>KVCFG_LOGICALPDF</code>	<p>This flag converts paragraphs in a PDF file in the order in which they appear on the page (logical reading order). The <code>nValue</code> argument specifies the paragraph direction. See Convert PDF Files to a Logical Reading Order, on page 92.</p>
<code>KVCFG_DELSOFTHYPHEN</code>	<p>If you set this flag, soft hyphens in the source document are removed, and the hyphenated words are joined in the HTML output. By default, soft hyphens are maintained. See Control Hyphenation, on page 98.</p> <p>Micro Focus recommends that you remove soft hyphens if you use Export to generate text output for an indexing engine or are not concerned with maintaining the document's layout. See fpConvertStream(), on page 156 or KVHTMLConvertFile(), on page 177 for more information on running Export in index mode.</p>
<code>KVCFG_INCLREVISIONMARK</code>	<p>If you set this flag to <code>TRUE</code>, text and graphics that were deleted from a</p>

Configuration Flags for KVHTMLConfig(), continued

Flag	Description
	<p>document with revision tracking enabled are converted, and revision information (revision title, reviewer name, and revision date and time) is included in the HTML output.</p> <p>To reset the flag and exclude deleted content and revision information from the HTML output, set the flag to <code>FALSE</code>. See Include Revision Information, on page 86.</p> <p>The default is <code>FALSE</code>.</p>
<code>KVCFG_BLANKPICTURE</code>	<p>If you set this flag to <code>TRUE</code>, graphics in a document are not converted, but an image tag is generated with an empty <code>src</code> attribute, creating an empty placeholder for the graphic. For example:</p> <pre></pre> <p>This allows you to generate output without graphics, but still maintain the text flow of the original document.</p> <p>This option applies to word processing formats only. The default is <code>FALSE</code>.</p>
<code>KVCFG_WP_NOCOMMENTS</code>	<p>Set this flag to <code>TRUE</code> not to export text from comments in Microsoft Word documents. Comment text is exported by default from Microsoft Word 97 to 2003 files.</p> <p>You can also toggle the display of comment output by modifying the <code>formats_e.ini</code> file. See Show Hidden Data, on page 108.</p>
<code>KVCFG_WP_SHOWHIDDENTEXT</code>	<p>Set this flag to <code>TRUE</code> to export hidden text from Microsoft Word documents.</p>
<code>KVCFG_WP_SHOWDATEFIELDPCODE</code>	<p>Set this flag to <code>TRUE</code> to export date field codes from Microsoft Word documents.</p>
<code>KVCFG_WP_SHOWFILENAMEFIELDPCODE</code>	<p>Set this flag to <code>TRUE</code> to export the file name field code from Microsoft Word documents.</p>
<code>KVCFG_SS_SHOWHIDDENINFOR</code>	<p>Set this flag to <code>TRUE</code> to export hidden information from Microsoft Excel files.</p>
<code>KVCFG_SS_SHOWCOMMENTS</code>	<p>Set this flag to <code>TRUE</code> to export comments from Microsoft Excel files.</p>
<code>KVCFG_SS_SHOWFORMULA</code>	<p>Set this flag to <code>TRUE</code> to export formulas from Microsoft Excel files.</p>
<code>KVCFG_PG_HIDEHIDDENSLIDE</code>	<p>Set this flag to <code>TRUE</code> not to export hidden slides from Microsoft PowerPoint files.</p>
<code>KVCFG_PG_HIDECOMMENT</code>	<p>Set this flag to <code>TRUE</code> not to export comments from Microsoft PowerPoint files. Comments are exported by default from PowerPoint 97 to 2000 files.</p>

Configuration Flags for KVHTMLConfig(), continued

Flag	Description
KVCFG_PG_SHOWCOMMENTSSSLIDE	Set this flag to TRUE to export comments slides from Microsoft PowerPoint 2003 and 2007 files.
KVCFG_PG_SHOWSLIDNOTES	<p>Set this flag to TRUE to export slide notes from Microsoft PowerPoint files.</p> <p>You can also toggle slide note output by modifying the <code>formats_e.ini</code> file. See Show Hidden Data, on page 108.</p>
KVCFG_SETPDFINVISIBLETEXTTOGGLE	<p>This flag enables a JavaScript button in exported PDF documents, which you can use to show and hide invisible text.</p> <p>Invisible text is hidden by default. See Toggle Invisible Text, on page 96.</p>
KVCFG_SETPDFINVISIBLETEXTOPACITY	<p>This flag allows you specify the degree of invisible text opacity in exported PDFs, from 0 (invisible) to 100 (invisible). Use this option if you want to view both the invisible text and the rasterized image in the document.</p> <p>Invisible text opacity is set to 0 by default. See Specify Opacity of Invisible Text, on page 97.</p>
KVCFG_SETPASSWORD	<p>This flag enables you to define a password used to open a password-protected file for export. See Export Password Protected Files, on page 395.</p> <p>nValue is TRUE.</p> <p>p is the source file password, which can have a maximum length of 255 characters (the final byte is null).</p>
KVCFG_TABNAVIGATION	<p>If you set this flag to TRUE, it enables a tabbed navigation view for spreadsheets. A row of tabs is displayed at the bottom of the browser window, and enables the user to switch between multiple sheets in a workbook.</p> <div>NOTE: JavaScript must be enabled.</div>

Examples

- To specify that the graphic-based PDF reader is used to convert PDF files:

```
(*fpHTMLConfig)(pKVHTML, KVCFG_SETHIFIPDF, TRUE, NULL);
```
- To specify that bookmarks in a PDF file are not used to generate a table of contents in the HTML output:

```
(*fpHTMLConfig)(pKVHTML, KVCFG_SUPPRESSTOCPRINTIMAGE, TRUE, NULL);
```

- To specify that rotated text in a file is displayed at 0 degrees at the bottom of the page on which it appears:

```
(*fpHTMLConfig)(pKVHTML, KVCFG_SETTEXTROTATE, TRUE, NULL);
```

- To set a directory for temporary files:

```
char    tmpDir[250];  
strcpy (tmpDir, "c:\\temp\\htmllexport");  
(*fpHTMLConfig)(pKVHTML, KVCFG_SETTEMPDIRECTORY, 0, tmpDir);
```

- To specify custom extraction settings for conversion of an XML file:

```
KVXConfigInfo    xinfo;  
(*fpHTMLConfig)(pKVHTML, KVCFG_SETXMLCONFIGINFO, 0, &xinfo);
```

- To specify that PDF files are converted to a logical reading order, and the paragraph direction for the PDF output is left to right:

```
(*fpHTMLConfig)(pKVHTML, KVCFG_LOGICALPDF, LPDF_LTR, NULL);
```

- To specify that PDF files are converted to a logical reading order, and the paragraph direction for the PDF output is right to left:

```
(*fpHTMLConfig)(pKVHTML, KVCFG_LOGICALPDF, LPDF_RTL, NULL);
```

- To specify that PDF files are converted to a logical reading order, and the paragraph direction for the PDF output is determined automatically for each page:

```
(*fpHTMLConfig)(pKVHTML, KVCFG_LOGICALPDF, LPDF_AUTO, NULL);
```

- To specify that soft hyphens are removed from the HTML output:

```
(*fpHTMLConfig)(pKVHTML, KVCFG_DELSOFTHYPHEN, TRUE, NULL);
```

- To convert text and graphics that are identified by revision marks:

```
KVRevisionMark    RMark;  
(*fpHTMLConfig)(pKVHTML, KVCFG_INCLREVISIONMARK, TRUE, &RMark))
```

- To generate a placeholder for all pictures:

```
(*fpHTMLConfig)(pKVHTML, KVCFG_BLANKPICTURE, TRUE, NULL);
```

- To toggle hidden data output from Microsoft Word documents, use one of the KVCFG_WP flags:

```
(*fpHTMLConfig)(pKVHTML, KVCFG_WP_NOCOMMENTS, TRUE, NULL);
```

- To toggle hidden data output from Microsoft Excel documents, use one of the KVCFG_SS flags:

```
(*fpHTMLConfig)(pKVHTML, KVCFG_SS_SHOWHIDDENINFOR, TRUE, NULL);
```

- To toggle hidden data output from Microsoft PowerPoint documents, use one of the KVCFG_PG flags:

```
(*fpHTMLConfig)(pKVHTML, KVCFG_PG_HIDEHIDDENSLIDE, TRUE, NULL);
```

- To enable an invisible text toggle button in exported PDF documents:

```
(*fpHTMLConfig)(pKVHTML, KVCFG_SETPDFINVESTTEXTTOGGLE, 0, szButtonName);
```

where `szButtonName` is a null-terminated string that determines the button name.

- To specify the opacity of invisible text in exported PDF documents:

```
(*fpHTMLConfig)(pKVHTML, KVCFG_SETPDFINVISIBLETEXTOPACITY, iInvisOpacity, NULL);
```

where `iInvisOpacity` is an integer from 0 (invisible) to 100 (fully visible).

- To specify a password to open a password-protected file for export:

```
(*fpHTMLConfig)(pKVHTML, KVCFG_SETPASSWORD, TRUE, password);
```

where `password` is a null-terminated string of 255 or fewer characters.

- To produce summary information in UTF8:

```
(*fpHTMLConfig)(pKVHTML, KVCFG_SETMETADATACHARSET, KVCS_UTF8, NULL);
```

KVHTMLConvertFile()

This function is called directly and converts a source file to an output file.

Syntax

```
BOOL pascal KVHTMLConvertFile (
    void                *pContext,
    void                *pCallingContext,
    char                *pInFileName,
    char                *pOutFileName,
    KVHTMLTemplateEx    *pTemplatesEx,
    KVHTMLOptionsEx     *pOptionsEx,
    KVHTMLCallbacksEx   *pCallbacksEx,
    KVHTMLTOCOptions    *pTOCCreateOptions,
    BOOL                bIndex,
    KVErrCode           *pError)
```

Arguments

<code>pContext</code>	A pointer returned from <code>fpInit()</code> .
<code>pCallingContext</code>	A pointer passed back to the callback functions.
<code>pInFileName</code>	A pointer to the input file.
<code>pOutFileName</code>	A pointer to the output file.
<code>pTemplatesEx</code>	<p>A pointer to the <code>KVHTMLTemplateEx</code> data structure. It defines the overall structure of the output. Individual elements within the structure define the markup written at specific points in the output stream. See KVHTMLTemplateEx, on page 217.</p> <p>If this pointer is <code>NULL</code>, the default values for the structure are used.</p>

<code>pOptionsEx</code>	<p>A pointer to the <code>KVHTMLOptionsEx</code> data structure. It defines the options that control the markup written in response to the general style and attributes (font, color, and so on) of the document. See KVHTMLOptionsEx, on page 208.</p> <p>If this pointer is <code>NULL</code>, the default values for the structure are used.</p>
<code>pCallbacksEx</code>	<p>A pointer to the <code>KVHTMLCallbacksEx</code> data structure. It is a structure of functions that Export calls for specific, user-defined purposes. See KVHTMLCallbacksEx, on page 200.</p> <p>If you do not use callbacks, this can be <code>NULL</code>. Only the <code>Continue()</code> callback can be used with <code>KVHTMLConvertFile()</code>.</p>
<code>pTOCCreateOptions</code>	<p>A pointer to the <code>KVHTMLTOCOptions</code> data structure. It specifies whether a heading is included in the table of contents. See KVHTMLTOCOptions, on page 222.</p> <p>If this pointer is <code>NULL</code>, the default values for the structure are used.</p>
<code>bIndex</code>	<p>Set this to <code>TRUE</code> to generate output with minimal markup and without images. Because the generated output is minimized to textual content, it is suitable for an indexing engine. If you set <code>bIndex</code> to <code>FALSE</code>, embedded images in a document are regenerated as separate files and stored in the output directory.</p> <p>You can also set this through the bNoPictures, on page 215 member in the template files.</p>
<code>pError</code>	<p>A pointer to an error code if the call to <code>KVHTMLConvertFile()</code> fails.</p>

Returns

- If the call is successful, the return value is `TRUE`.
- If the call is unsuccessful, the return value is `FALSE`.

Discussion

- Only `pContext`, `pInFileName`, `pOutFileName`, and `bIndex` are required. All other pointers should be `NULL` when they are not set.
- If `pCallbacksEx` is `NULL`, `pOptionsEx->pszDefaultOutputDirectory` must be valid, except when you set `bIndex` to `TRUE`.
- This function runs in-process or out of process. See [Convert Files Out of Process, on page 29](#).
- When converting out of process, you must call this function after the call to `KVHTMLStartOOPSession()` and before the call to `KVHTMLEndOOPSession()`. See [KVHTMLStartOOPSession\(\), on page 183](#) and [KVHTMLEndOOPSession\(\), on the next page](#).
- When converting out of process, the values for the `KVHTMLTemplateEx`, `KVHTMLOptionsEx`, and `KVHTMLTOCOptions` structures should be set to `NULL`. These structures are already passed in the call to `KVHTMLStartOOPSession()`. See [KVHTMLStartOOPSession\(\), on page 183](#).

Example

```
if(!(*KVHTMLInt.KVHTMLConvertFile)(
    pKVHTML,          /* A pointer returned by fpInit() */
    NULL,             /* A pointer for callback functions */
    &InputFile,        /* Input file */
    &OutputFile,       /* Output file */
    &HTMLTemplates,    /* Markup and related variables */
    &HTMLOptions,      /* Options */
    NULL,             /* A pointer to callback functions */
    NULL,             /* TOC options */
    FALSE,            /* Index mode */
    &error))          /* The error return value */
{
    printf("Error converting %s to HTML %d\n", argv[i - 1], error);
}
else
{
    printf("Conversion of %s to HTML completed.\n\n", argv[i - 1]);
}
```

KVHTMLEndOOPSession()

This function terminates the current out-of-process conversion session, and releases the source data and resources related to the session.

Syntax

```
BOOL pascal KVHTMLEndOOPSession(
    void          *pContext,
    BOOL          bKeepServantAlive,
    KVErrCodeEx   *pError
    DWORD         dwOptions,
    void          *pReserved1,
    void          *pReserved2 );
```

Arguments

<code>pContext</code>	A pointer returned from <code>fpInit()</code> .
<code>bKeepServantAlive</code>	Set this to <code>TRUE</code> to keep a Servant process active after the Export out-of-process session is terminated. If the Servant remains active, subsequent conversion requests are processed more quickly because the Servant is already prepared to receive data.

	Set this to FALSE to terminate the Export out-of-process session and the associated Servant process.
pError	A pointer to an error code defined in KVErrCodeEx in kvtypes.h.
dwOptions	Reserved for future use.
pReserved1	Reserved for future use.
pReserved2	Reserved for future use.

Returns

- If the call is successful, the return value is **TRUE**.
- If the call is unsuccessful, the return value is **FALSE**.

Example

The following sample code is from the `cnv2htmlloop` sample program:

```
/* declare endsession function pointer */
BOOL (pascal *fpKVHTMLEndOOPSession)( void *,
    BOOL
    ,
    KVErrCode
    *,
    DWORD
    ,
    void
    *,
    void
    *);
/* assign OOP endsession function pointer */
fpKVHTMLEndOOPSession = (BOOL (pascal *) ( void *,
    BOOL
    ,
    KVErrCode
    *,
    DWORD
    ,
    void
    *,
    void
    * ))mpGetProcAddress(hKVHTML,
"KVHTMLEndOOPSession");
if(!fpKVHTMLEndOOPSession)
{
    printf("Error assigning KVHTMLEndOOPSession() pointer\n");
    (*KVHTMLInt.fpFileToInputStreamFree)(pKVHTML, &Input);
    (*KVHTMLInt.fpFileToOutputStreamFree)(pKVHTML, &Output);
    mpFreeLibrary(hKVHTML);
    return 8;
}
/*****END OOP SESSION, DO NOT KEEP SERVANT ALIVE *****/
if(!(*fpKVHTMLEndOOPSession)(pKVHTML,
    FALSE,
    &error,
    0,
    NULL,
```

```
        NULL))  
{  
    printf("Error calling fpKVHTMLEndOOPSession \n");  
    (*KVHTMLInt.fpFileToInputStreamFree)(pKVHTML, &Input);  
    (*KVHTMLInt.fpFileToOutputStreamFree)(pKVHTML, &Output);  
    (*KVHTMLInt.fpShutDown)(pKVHTML);  
    mpFreeLibrary(hKVHTML);  
    return 10;  
}
```

KVHTMLSetHighlightO

This function is called directly and enables you to specify search terms that are found and highlighted in the HTML output. See [Search and Highlight Terms, on page 85](#). The `htmlini` sample program demonstrates this function. See [htmlini, on page 118](#).

Syntax

```
int pascal_export KVHTMLSetHighlight(  
    void          *pContext,  
    KVHTMLHighlight *pHLConfig,  
    void          *pReserved1,  
    void          *pReserved2 );
```

Arguments

- `pContext` A pointer returned from `fpInit()`.
- `pHLConfig` A pointer to the `KVHTMLHighlight` data structure. This structure defines the terms to be found and the highlight format applied. See [KVHTMLHighlight, on page 203](#).
- `pReserved1` Reserved for future use.
- `pReserved2` Reserved for future use.

Returns

- If the call is successful, the return value is `KVERR_Success`.
- If the call is unsuccessful, the return value is an error code.

Discussion

- This function must be called after the call to `fpInit()` and before the call to `fpConvertStream()` or `KVHTMLConvertFile()`.
- When converting out of process, this function must be called before the call to `KVHTMLStartOOPSession()`. See [Convert Files Out of Process, on page 29](#).

Example

```
KVHTMLHighlight    HTMLHighlight;
int (pascal *fpHTMLSetHighlight)(void *, KVHTMLHighlight *, void *, void *);
//get function pointer and call the function
fpHTMLSetHighlight = (int (pascal *)
    (void *, KVHTMLHighlight *, void *, void*))myGetProcAddress(hKVHTML,
    "KVHTMLSetHighlight");
    if(!fpHTMLSetHighlight)
    {
        printf("Error accessing HTMLSetHighlight().\n");
    }
    else
    {
        if(KVERR_Success != (*fpHTMLSetHighlight)(pKVHTML, &HTMLHighlight, NULL,
NULL))
        {
            printf("Error setting HTML highlight.\n");
        }
    }
}
```

KVHTMLSetStyleSheet()

This function is called directly and is used to specify the full path and file name of an external Cascading Style Sheet (CSS).

Syntax

```
BOOL pascal KVHTMLSetStyleSheet(
    void    *pContext,
    char    *pszStyleSheetName,
    char    *pszRef);
```

Arguments

pContext	A pointer returned from fpInit().
pszStyleSheetName	A pointer to the full path and file name of the style sheet.
pszUrlRef	A pointer to the URL or file name of style sheet.

Returns

- If the call is successful, the return value is `TRUE`.
- If this call is unsuccessful, the return value is `FALSE`.

Discussion

- When the value for `eStyleSheetType` in `KVHTMLOptionsEx` is set to `CSS_TOFILE`, and the token `$STYLESHEET` is specified in the templates, an external CSS file is referenced in the output HTML by a `LINK` statement of the form:

```
<LINK rel="STYLESHEET" href="pszRef" type="text/css">
```

- If the name of the style sheet is not specified by using this function, a style sheet file is created with an automatically generated file name.
- If this function is used to specify the name of the style sheet file, that file name is used in the conversion.
 - If the file does not exist in the specified location, it is created.
 - If the file exists, but is empty, CSS styles are written to the file.
 - If the file exists and is not empty, the conversion attempts to use the predefined styles, and appends any new styles that are required for the conversion.
- If the value for `pszStyleSheetName` includes the output directory, the `href` only consists of the file name because the HTML output resides in the same directory as the CSS file.
- If the value for `pszStyleSheetName` points to a directory other than the output directory, the `href` consists of the full path and file name.
- If the value for `pszStyleSheetName` points to a file that is not a CSS file or to a non-existent directory, the `LINK` statement is written; but, the style sheet information is added inline (`CSS_INLINE`), and an external CSS file is not generated.
- If there are multiple calls made to `fpConvertStream()` or `KVHTMLConvertFile()`, and the name of the style sheet is set with `KVHTMLSetStyleSheet`, the file name can be disabled by calling `KVHTMLSetStyleSheet` again with the `pszStyleSheetName` and `pszRef` set to `NULL`. The file name can then be set to a different value by calling `KVHTMLSetStyleSheet` with the new file name prior to the next call to `fpConvertStream()` or `KVHTMLConvertFile()`.
- This function runs in-process or out of process. See [Convert Files Out of Process, on page 29](#).
- When converting out of process, this function must be called after the call to `KVHTMLStartOOPSession()` and before the call to `KVHTMLEndOOPSession()`. See [KVHTMLStartOOPSession\(\), below](#) and [KVHTMLEndOOPSession\(\), on page 179](#).

KVHTMLStartOOPSession()

This function performs the following:

- Initializes the out-of-process session.
- Specifies the input stream or file.

- Passes conversion options from the `KVHTMLTemplateEx`, `KVHTMLOptionsEx`, and `KVHTMLTOCOptions` data structures.
- Creates a Servant process.
- Establishes a communication channel between the application thread and the Servant.
- Sends the data to the Servant.

Syntax

```
BOOL pascal KVHTMLStartOOPSession(  
    void *pContext,  
    KVInputStream *pInputStream,  
    char *pFileName,  
    KVHTMLTemplateEx *pTemplatesEx,  
    KVHTMLOptionsEx *pOptionsEx,  
    KVHTMLTOCOptions *pTOCCreateOptions  
    DWORD *pPID,  
    KVErrCode *pError  
    DWORD dwOptions,  
    void *pReserved1,  
    void *pReserved2 );
```

Arguments

<code>pContext</code>	A pointer returned from <code>fpInit()</code> .
<code>pInputStream</code>	<p>A pointer to the developer-assigned instance of <code>KVInputStream</code>. The <code>KVInputStream</code> structure defines the input stream containing the source for the conversion.</p> <p>If <code>pInput</code> is defined, then <code>pFileName</code> must be <code>NULL</code>. The input data can be defined as a data stream or file, but not both.</p>
<code>pFileName</code>	<p>A pointer to the file to be converted. The file must exist on the same file system as the Servant.</p> <p>If <code>pFileName</code> is defined, then <code>pInput</code> must be <code>NULL</code>. The input data can be defined as a data stream or file, but not both.</p>
<code>pTemplatesEx</code>	<p>A pointer to the <code>KVHTMLTemplateEx</code> data structure. It defines the overall structure of the output. Individual elements within the structure define the markup written at specific points in the output stream. See KVHTMLTemplateEx, on page 217.</p> <p>If this pointer is <code>NULL</code>, the default values for the structure are used.</p>
<code>pOptionsEx</code>	<p>A pointer to the <code>KVHTMLOptionsEx</code> data structure. It defines the options that control the markup written in response to the general style and attributes (font, color, and so on) of the document. See KVHTMLOptionsEx, on page 208.</p> <p>If this pointer is <code>NULL</code>, the default values for the structure are used.</p>

pTOCCreateOptions	A pointer to the KVHTMLTOCOptions data structure. It specifies whether a heading is included in the table of contents. See KVHTMLTOCOptions , on page 222 . If this pointer is NULL, the default values for the structure are used.
pPID	Address of a DWORD into which the Servant process ID is returned.
pError	A pointer to an error code defined in KVErrCode in kvtypes.h.
dwOptions	Reserved for future use.
pReserved1	Reserved for future use.
pReserved2	Reserved for future use.

Returns

If the call is successful, the return value is TRUE.

If the call is unsuccessful, the return value is FALSE.

Discussion

- After the out-of-process session is started successfully, all conversion functions can be called. The data is then processed on the Servant until the session is terminated by a call to [KVHTMLEndOOPSession\(\)](#), on [page 179](#).
- All functions that can run out of process must be called within the out-of-process session, that is, after the call to KVHTMLStartOOPSession(), and before the call to KVHTMLEndOOPSession().
- The KVHTMLConvertFile() function can only be called once in a single out-of-process session.
- Since the KVHTMLTemplateEx, KVHTMLOptionsEx, and KVHTMLTOCOptions data structures are passed by this function, the same pointers in the call to KVHTMLConvertFile() are ignored.

Example

The following sample code is from the cnv2htmlloop sample program:

```
/* declare OOP startsession function pointer */
BOOL (pascal *fpKVHTMLStartOOPSession)( void *,
    KVInputStream *,
    char *,
    KVHTMLTemplateEx *,
    KVHTMLOptionsEx *,
    KVHTMLTOCOptions *,
    DWORD *,
    KVErrCode *,
    DWORD,
    void *,
    void * );
```

```

/* assign OOP startsession function pointer */
fpKVHTMLStartOOPSession = (BOOL (pascal *) (void *,
        KVInputStream *,
        char *,
        KVHTMLTemplateEx *,
        KVHTMLOptionsEx *,
        KVHTMLTOCOptions *,
        DWORD *,
        KVErrCode *,
        DWORD,
        void *,
        void * ))mpGetProcAddress(hKVHTML,
"KVHTMLStartOOPSession");
if(!fpKVHTMLStartOOPSession)
{
    printf("Error assigning KVHTMLStartOOPSession() pointer\n");
    (*KVHTMLInt.fpFileToInputStreamFree)(pKVHTML, &Input);
    (*KVHTMLInt.fpFileToOutputStreamFree)(pKVHTML, &Output);
    mpFreeLibrary(hKVHTML);
    return 7;
}
/*****START OOP SESSION *****/
if(!(*fpKVHTMLStartOOPSession)(pKVHTML,
    &Input,
    NULL,
    &HTMLTemplates, /* Markup and related variables */
    &HTMLOptions, /* Options */
    NULL, /* TOC options */
    &oopServantPID,
    &error,
    0,
    NULL,
    NULL))
{
    printf("Error calling fpKVHTMLStartOOPSession \n");
    (*KVHTMLInt.fpFileToInputStreamFree)(pKVHTML, &Input);
    (*KVHTMLInt.fpFileToOutputStreamFree)(pKVHTML, &Output);
    (*KVHTMLInt.fpShutDown)(pKVHTML);
    mpFreeLibrary(hKVHTML);
    return 9;
}

```

Chapter 9: HTML Export API Callback Functions

This section describes the HTML Export API callback functions.

• Introduction	187
• Continue()	187
• GetAnchor()	188
• GetAuxOutput()	189
• UserCB()	190

Introduction

The `fpConvertStream()` and `KVHTMLConvertFile()` functions enable you to specify a callback function. A callback function controls the conversion while it is in progress. For example, you can specify a callback function to report progress during the conversion.

To use the API callback functions, declare one or more instances of the `KVHTMLCallbacksEx` structure. Each member of this instance can then be initialized by assigning a function pointer to the application-defined callback functions, cast to the appropriate function prototype. Each instance of `KVHTMLCallbacksEx` can define unique callback functions. Alternatively, the functions can be common to all instances of `KVHTMLCallbacksEx`; these functions take appropriate action, depending on the value of the pointer `pCallingContext`.

The second parameter (`pCallingContext`) of the call to `fpConvertStream()` and `KVHTMLConvertFile()` provides a void pointer used to identify the context of this call. If more than one call to `fpConvertStream()` or `KVHTMLConvertFile()` is made within a single application, any resulting callbacks are identified by the first parameter of the callback function. This enables the callback function to take any appropriate action, depending on which calling context is returned.

The seventh parameter (`pCallbacks`) of the call to `fpConvertStream()` and `KVHTMLConvertFile()` must be set to the address of the `KVHTMLCallbacksEx` structure to be used for this call.

For sample code, see the sample program `callback.c`. It creates a frame-based HTML stream and demonstrates the use of the callback functions.

Continue()

When `fpConvertStream()` or `KVHTMLConvertFile()` is called, control is not returned to the application until the entire document is processed. This callback function provides a means of monitoring progress and terminating the conversion process before the conversion is completed.

Syntax

```
BOOL (pascal *Continue) (  
    void      *pCallingContext,
```

```
int nPercentComplete);
```

Arguments

- pCallingContext** A pointer passed back to the caller-provided callback functions. This pointer, which can be NULL, is specified as the second parameter of the call to `fpConvertStream()` and `KVHTMLConvertFile()`.
- nPercentComplete** The approximate percentage of the current conversion that is completed.
- You can monitor the progress of the conversion by checking the value of `nPercentDone`, which indicates how many blocks out of the total number of blocks have been processed.

Returns

- If the call is successful, the return value is `TRUE`.
- If the call is unsuccessful, the return value is `FALSE`. Processing is halted.

Discussion

- There is a callback to this function for every entry that appears in the generated table of contents.
- The application is free to execute any required code in the callback function, with the exception of `fpShutDown()`.

GetAnchor()

This function gets the file name automatically generated by Export and used for external graphics referenced with `` tags, heading-level table of contents entries, and external files (such as CSS files and revision summary files).

Syntax

```
BOOL (pascal *GetAnchor) (
    void *pCallingContext,
    KVHTMLXMLAnchorTypeEx eAnchorTypeEx,
    char *pszAnchor,
    int cbAnchorMax,
    BYTE *pHTML,
    UINT cbHTML);
```

Arguments

- pCallingContext** A pointer that gets passed back to the caller-provided callback functions. This

	pointer, which can be <code>NULL</code> , is specified as the second parameter of the call to <code>fpConvertStream()</code> .
<code>eAnchorTypeEx</code>	The anchor type for the output stream. It must be one of the enumerated types defined in <code>KVHTMLAnchorTypeEx</code> .
<code>pszAnchor</code>	A pointer to the location where the new anchor is stored.
<code>cbAnchorMax</code>	The maximum number of bytes to place in <code>pszAnchor</code> .
<code>pchTML</code>	This is either <code>NULL</code> or a pointer to one of the following: <ul style="list-style-type: none">• markup defining the contents of a table of contents entry• the external graphic file name• the external file name
<code>cbHTML</code>	The number of valid bytes in <code>pchTML</code> .

Returns

- If the call is successful, the return value is `TRUE`.
- If the call is unsuccessful, the return value is `FALSE`. Processing is halted.

Discussion

- If this callback is `NULL`, default anchor names are generated. The generated names are unique across the document.
- This function is called once per block, block chunk, graphic anchor, or extra file. Any required code can be executed here as long as a unique value for `pszAnchor` is assigned. If this string is not unique, an existing file might be overwritten, producing undesirable results. The callback function should contain the functionality to verify whether files already exist.
- If you want to specify graphic anchor names, but use default anchor names for all other anchors, provide the graphic names when `eAnchorTypeEx` is `VectorPictureAnchorEx` or `RasterPictureAnchorEx`. For all other anchor types, call with the same parameters you were passed.
- `pszAnchor` must be assigned. It can be derived from the `cbAnchorMax`, `pchTML`, and `cbHTML` values, which are also provided.
- `pchTML` can be null if the graphic is an internal part of the document.

GetAuxOutput()

This callback function enables the calling application to specify an auxiliary output stream for a block or graphic.

Syntax

```
BOOL (pascal *GetAuxOutput) (  
    void                *pCallingContext,  
    KVHTMLXMLAnchorTypeEx eAnchorTypeEx,  
    char                *pszAnchor,  
    KVOutputStream      *pNewOutput);
```

Arguments

<code>pCallingContext</code>	A pointer passed back to the caller-provided callback functions. This pointer, which can be NULL, is specified as the second parameter of the call to <code>fpConvertStream()</code> .
<code>eAnchorTypeEx</code>	A graphic or block anchor as defined by the enumerated types in <code>KVHTMLAnchorTypeEx</code> .
<code>pszAnchor</code>	A pointer to location where a new anchor is stored. <code>pszAnchor</code> is based on the call to <code>GetAnchor()</code> .
<code>pNewOutput</code>	A pointer to a <code>KVOutputStream</code> structure that can be used to write data to the current block.

Returns

- If the call is successful, the return value is TRUE.
- If the call is unsuccessful, the return value is FALSE. Processing is halted.

Discussion

- If `GetAuxOutput()` is NULL, the `pszDefaultOutputDirectory` member of the instance of `KVHTMLOptionsEx` is used as the base storage location for auxiliary output files. If `pszDefaultOutputDirectory` is also NULL, auxiliary files are placed in the current working directory.
- For each `pszAnchor` provided, create (`malloc`) an appropriate I/O structure. Assign `pNewOutput->pOutputStreamPrivateData` to point to that structure. Each remaining member of the `KVOutputStream` should then be initialized by assigning a function pointer to the additional application-defined functions, cast to the appropriate function prototype for `Create()`, `Write()`, `Seek()`, `Tell()`, and `Close()`. Memory allocated to the I/O structure must be tracked and can be freed up within the call to `Close()`. See the `callback.c` sample program.

UserCB()

This callback function is triggered by including the `$USERCB` token in a member of `KVHTMLTemplateEx`. For example, placing “`$USERCB=my_callback`” in `pszFirstH1Start` results in a callback at the point

when `pszFirstH1Start` is processed. The user callback function is identified by the text assigned to `$USERCB`, which in this example is `my_callback`. This identifier is passed to the argument `pszUserCBid`.

Syntax

```
BOOL (pascal *UserCB) (  
    void                *pCallingContext,  
    char                *pszUserCBid,  
    KVOutputStream      *pNewOutput  
    void                *pReserved);
```

Arguments

<code>pCallingContext</code>	A pointer that gets passed back to the caller-provided callback function. This pointer, which can be <code>NULL</code> , is specified as the second parameter of the call to <code>fpConvertStream()</code> .
<code>pszUserCBid</code>	A pointer to a string that identifies the source of the callback. The identifier must be delimited by a trailing white space. For example, <code>"my_callback "</code> .
<code>pNewOutput</code>	A pointer to a <code>KVOutputStream</code> structure that can be used to write data to the current block.
<code>pReserved</code>	Reserved for future use.

Returns

- If the call is successful, the return value is `TRUE`.
- If the call is unsuccessful, the return value is `FALSE`. Processing is halted.

Chapter 10: HTML Export API Structures

This section provides information on the structures used by the HTML Export API. These structures are defined in `kvhtml.h`, `kvtypes.h`, and `adinfo.h`.

• ADDDOCINFO	192
• KVInputStream	193
• KVMemoryStream	194
• KVOutputStream	194
• KVSTR	195
• KVStreamInfo	195
• KVStructHead	196
• KVStyle	197
• KVSumInfoElemEx	198
• KVSummaryInfoEx	198
• KVXConfigInfo	199
• KVHTMLCallbacksEx	200
• KVHTMLHeadingInfo	201
• KVHTMLHighlight	203
• KVHTMLInterfaceEx	204
• KVHTMLInterfaceEx2	206
• KVHTMLOptionsEx	208
• KVHTMLTemplateEx	217
• KVHTMLTOCOptions	222
• KVRevisionMark	223
• KV_RM_Title	224

ADDDOCINFO

This structure provides the format, file class, and version number of the source document. It is defined in `adinfo.h`, and is initialized by calling the `fpGetStreamInfo()` function. See [fpGetStreamInfo\(\)](#), on [page 165](#).

```
typedef struct
{
    ENdocClass      eClass;
    ENdocFmt        eFormat;
    long            lVersion;
    unsigned long    ulAttributes;
}
ADDDOCINFO, *ADDDOCINFOPTR;
```

Member Descriptions

<code>eClass</code>	The file class of the source document (for example, spreadsheet, word processor, or encapsulation format) as defined by the <code>ENdocClass</code> enumerated type in <code>adinfo.h</code> .
<code>eFormat</code>	The major format of the source document (such as Microsoft Word or Corel Presentation) as defined by the <code>ENdocFmt</code> enumerated type in <code>adinfo.h</code> .
<code>lVersion</code>	The version number of the file format. The number is multiplied by 1000. For example, 1.02 is represented by 1020.
<code>ulAttributes</code>	Other attributes of the document as defined by the <code>ENdocAttributes</code> enumerated type in <code>adinfo.h</code> .

Discussion

When format detection is enhanced in future releases, new format IDs might be added to the `ENdocFmt` enumerated type. When you use this type, your code should ensure binary compatibility with future releases. For example, if you use an array to access format information based on a format ID, your code should check that the format ID is less than `Max_Fmt` before accessing the data. This ensures that new format codes are detected when you add KeyView binary files from new releases to your existing installation.

KVInputStream

This structure defines an input stream for the HTML conversion.

```
typedef struct tag_InputStream
{
    void *pInputStreamPrivateData;
    long lcbFilesize;
    BOOL (pascal *fpOpen) (struct tag_InputStream *);
    UINT (pascal *fpRead) (struct tag_InputStream *, BYTE *, UINT);
    BOOL (pascal *fpSeek) (struct tag_InputStream *, long, int);
    long (pascal *fpTell) (struct tag_InputStream *);
    BOOL (pascal *fpClose)(struct tag_InputStream *);
}
KVInputStream;
```

Member Descriptions

All member functions are equivalent to their counterparts in the ANSI standard library, except `fpOpen()`, which returns `FALSE` on failure. On `fpOpen()`, if the size of the stream is known, assign that value to `lcbFilesize`. Otherwise, set `lcbFilesize` to 0.

KVMemoryStream

This structure defines an optional memory allocator to be used by HTML Export. It is initialized by calling `fpInit()`. See [fpInit\(\)](#), on page 167.

```
typedef struct tag_MemoryStream
{
    void *pMemoryStreamPrivateData;
    void * (pascal *fpMalloc)(struct tag_MemoryStream*,size_t);
    void (pascal *fpFree) (struct tag_MemoryStream*, void *);
    void * (pascal *fpRealloc)(struct tag_MemoryStream*,void *, size_t);
    void * (pascal *fpCalloc)(struct tag_MemoryStream*, size_t, size_t);
}
KVMemoryStream;
```

Member Descriptions

All member functions are equivalent to their counterparts in the ANSI standard library.

Discussion

- `fpRealloc()` must handle a NULL pointer.
- For systems that do not support `fpRealloc()`, refer to the `callback` sample program, which demonstrates how to use the memory management features.
- If `KVMemoryStream` is not provided, the default C run-time memory allocation is used.

KVOutputStream

This structure defines an output stream for the HTML conversion.

```
typedef struct tag_OutputStream
{
    void *pOutputStreamPrivateData;
    BOOL (pascal *fpCreate)(struct tag_OutputStream *,TCHAR *);
    UINT (pascal *fpWrite) (struct tag_OutputStream *, BYTE *, UINT);
    BOOL (pascal *fpSeek) (struct tag_OutputStream *, long, int);
    long (pascal *fpTell) (struct tag_OutputStream *);
    BOOL (pascal *fpClose) (struct tag_OutputStream *);
}
KVOutputStream;
```

Member Descriptions

All member functions are equivalent to their counterparts in the ANSI standard library.

KVSTR

This structure is used to identify string types (string text and byte count) for the first three members of `KVStyle`. See [KVStyle](#), on page 197.

```
typedef struct tag_KVSTR
{
    char    *pcString;
    int     cbString;
}
KVSTR;
```

Member Descriptions

`pcString` A text string.

`cbString` The length of `pcString`, excluding the terminating NULL(s). This allows UNICODE or double bytes to be employed.

KVStreamInfo

This structure defines a document's character set and format. It is initialized by calling `fpGetStreamInfo()`. See [fpGetStreamInfo\(\)](#), on page 165.

```
typedef struct tag_KVStreamInfo
{
    KVCharSet    charset;
    ADDOCINFO    adInfo;
}
KVStreamInfo;
```

Member Descriptions

`charset` The character set of the source document, if that information is ascertainable. The available character sets are enumerated in `KVCharSet` in `kvtypes.h`. See [Convert Character Sets](#), on page 76.

`adInfo` The file class, major format, and version of the source document. A pointer to the `ADDOCINFO` structure. The structure of `ADDOCINFO` is defined in `adinfo.h`. See [ADDOCINFO](#), on page 192.

- `adInfo.eClass` represents the class of the source document, as defined by the `ENdocClass` enumerated type.
- `adInfo.eFormat` represents the format of the source document, as defined by the `ENdocFmt` enumerated type.

- `adInfo.lVersion` represents the version number of the file format. The number is multiplied by 1000. For example, 1.02 is represented by 1020.
- `adInfo.ulAttributes` represents other attributes of the document as defined by the `ENdocAttributes` enumerated type.

Discussion

When format detection is enhanced in future releases, new format IDs might be added to the `ENdocFmt` enumerated type. When you use this type, your code should ensure binary compatibility with future releases. For example, if you use an array to access format information based on a format ID, your code should check the format ID is less than `Max_Fmt` before accessing the data. This ensures that new format codes are detected when you add KeyView binary files from new releases to your existing installation.

KVStructHead

This structure contains the current KeyView version number and is the first member of other structures. It enables Micro Focus to modify the structures in future releases, but to maintain backward compatibility. Before initializing a structure that contains the `KVStructHead` structure, use the macro `KVStructInit` to initialize `KVStructHead`. The structure and macro are defined in `kvtypes.h`.

```
typedef struct _KVStructHead
{
    WORD        version;
    WORD        size;
    DWORD       reserved;
    void        *internal;
} KVStructHeadRec, *KVStructHead;
```

Member Descriptions

<code>version</code>	The current KeyView version number. This is a symbolic constant (<code>KeyviewVersion</code>) defined in <code>kvxtract.h</code> . This constant is updated for each KeyView release.
<code>size</code>	The size of the <code>KVStructHeadRec</code> .
<code>reserved</code>	Reserved for internal use.
<code>internal</code>	Reserved for internal use.

Example

```
KVStructInit(&openArg);
```

KVStyle

This structure defines the style mapping support for KVSTR-defined styles. The first three members of KVStyle are KVSTR structures (see [KVSTR, on page 195](#)). Each KVSTR structure contains the text string and byte count for StyleName, MarkupStart, and MarkupEnd. The structure is initialized by calling the function fpSetStyleMapping().

See [fpSetStyleMapping\(\), on page 168](#) and [Map Styles, on page 81](#).

HTML Export supports both paragraph styles and character styles. It works on the assumption that each style has a unique name. Only one paragraph style can be active at one time; therefore, the opening of a new paragraph style automatically closes the previous paragraph style. By contrast, several character styles can be active at once. When HTML Export receives an EndCharStyle token from the format parser, the most recent character style is terminated.

```
typedef struct tag_KVStyles
{
    KVSTR    StyleName;
    KVSTR    MarkupStart;
    KVSTR    MarkupEnd;
    DWORD    dwFlags;
}
KVStyle;
```

Member Descriptions

StyleName	The name of the word processing style (for example, "Heading 1") to which style mapping applies. A pointer to the KVSTR structure. See KVSTR, on page 195 . Style names are case sensitive.
MarkupStart	The markup added to the beginning of a paragraph or character style. A pointer to the KVSTR structure. See KVSTR, on page 195 .
MarkupEnd	The markup added to the end of a paragraph or character style. A pointer to the KVSTR structure. See KVSTR, on page 195 .
dwFlags	Instructions on how to process the content associated with a paragraph or character style. The flag can be one of the types defined in kvtypes.h. They are described in Flags for Defining Styles, on page 83 . The value associated with each flag is a hexadecimal number. You can set an option by either entering the converted decimal value, or by entering the flag's text (for example, KVSTYLE_PRE). The value of Flags in the template files is passed to this member of KVStyle.

Discussion

- This structure applies to word processing documents only.
- By default, HTML Export maps the heading style "Heading 1" to <h1></h1>, and so on, for heading levels 1 through 6. If you use style mappings, the default mapping is overridden. Therefore, you must supply markup for *all* heading levels.
- When the user-defined markup in `KVStyle` conflicts with other markup generated by HTML Export, the user-defined markup takes precedence.

KVSumInfoElemEx

This structure defines the individual metadata elements.

```
typedef struct tag_KVSumInfoElemEx
{
    int             isValid;
    KVSumInfoType   type;
    void            *data;
    char            *pcType;
}
KVSumInfoElemEx;
```

Member Descriptions

<code>isValid</code>	Specifies whether the data value is present in the document. The setting 1 specifies that the value is valid and exists.
<code>type</code>	The data type of the metadata element. The types are defined in the <code>KVSumInfoType</code> structure in <code>kvtypes.h</code> . See KVSumInfoType, on page 239 .
<code>data</code>	The content of the metadata field. If the <code>type</code> member is <code>KV_Int4</code> or <code>KV_Bool</code> , this member contains the actual value. Otherwise, this member is a pointer to the actual value. <code>KV_DateTime</code> and <code>KV_IEEE8</code> point to an 8-byte value. <code>KV_String</code> and <code>KV_Unicode</code> point to the beginning of the string that contains the text.
<code>pcType</code>	A pointer to the name of the metadata field.

KVSummaryInfoEx

This structure provides a count of the number of metadata elements, and a pointer to the first element of the array of individual elements. The structure is initialized by calling the `fpGetSummaryInfo()` function. See [fpGetSummaryInfo\(\), on page 165](#).

```
typedef struct tag_KVSummaryInfoEx
{
    int                nElem;
    KVSumInfoElemEx    *pElem;
}
KVSummaryInfoEx;
```

Member Descriptions

nElem The number of metadata elements contained in the array. **nElem** can be zero. This indicates that the document did not contain metadata, such as an ASCII text document.

pElem Points to the first element of the array of document metadata elements defined by the **KVSumInfoElemEx** structure. See [KVSumInfoElemEx, on the previous page](#).

KVXConfigInfo

This structure defines an XML document type and the element extraction settings for that type. The settings can be applied based on the file format ID, or the file's root element. This structure is in **kvtypes.h** and is initialized by calling the **KVHTMLConfig()** function. See [Convert XML Files, on page 104](#) and [KVHTMLConfig\(\), on page 170](#).

```
typedef struct TAG_KVXConfigInfo
{
    ENdocFmt    eKVFormat;
    char*       pszRoot;
    char*       pszInMeta;
    char*       pszExMeta;
    char*       pszInContent;
    char*       pszExContent;
    char*       pszInAttribute;
}KVXConfigInfo;
```

Member Descriptions

eKVFormat The format ID as detected by the KeyView detection module. This determines the file type to which these extraction settings apply. The format ID is defined by the **ENdocFmt** enumerated type in **adinfo.h**. See [File Format Detection, on page 362](#) for more information on format ID values.

If you are adding configuration settings for a custom XML document type, this is not defined.

pszRoot The file's root element. When the format ID is not defined, the root element is used to determine the file type to which these settings apply.

To further qualify the element, specify its namespace. See [Specify an Element's Namespace and Attribute, on page 107](#).

pszInMeta	<p>The elements extracted from the file as metadata. All other elements are extracted as text. Multiple entries must be separated by commas.</p> <p>To further qualify the element, specify its namespace, its attributes, or both. See Specify an Element's Namespace and Attribute, on page 107.</p>
pszExMeta	<p>The child elements in the included metadata elements that are not extracted from the file as metadata. For example, the default extraction settings for the Visio XML format extract the <code>DocumentProperties</code> element as metadata. This element includes child elements such as <code>Title</code>, <code>Subject</code>, <code>Author</code>, <code>Description</code>, and so on. However, the child element <code>PreviewPicture</code> is defined in <code>pszExMeta</code> because it is binary data and should not be extracted.</p> <p>You cannot exclude any metadata elements from the output for StarOffice files. All metadata is extracted regardless of this setting.</p> <p>To further qualify the element, specify its namespace, its attributes, or both. See Specify an Element's Namespace and Attribute, on page 107.</p>
pszInContent	<p>The elements extracted from the file as content text. An asterisk (*) extracts all elements including child elements.</p> <p>To further qualify the element, specify its namespace, its attributes, or both. See Specify an Element's Namespace and Attribute, on page 107.</p>
pszExContent	<p>The child elements in the included content elements that are not extracted from the file as content text.</p> <p>To further qualify the element, specify its namespace, its attributes, or both. See Specify an Element's Namespace and Attribute, on page 107.</p>
pszInAttribute	<p>The attribute values extracted from the file. If attributes are not defined, attribute values are not extracted. The namespace (if used), element name, and attribute name must be defined in the following format:</p> <pre>namespace:elementname@attributename</pre> <p>For example:</p> <pre>microfocus:division@name</pre>

KVHTMLCallbacksEx

This structure provides all callbacks that can result from a call to `fpConvertStream()` or `KVHTMLConvertFile()`. See [fpConvertStream\(\), on page 156](#) and [KVHTMLConvertFile\(\), on page 177](#). Any and all of the function pointers can be NULL.

```
typedef BOOL (pascal *KVHTMLCB_CONTINUE)(
    void                *pcallingContext,
    int                 nPercentDone);
typedef BOOL (pascal *KVHTMLCB_GETANCHOREX)(
    void                *pCallingContext,
    KVHTMLAnchorTypeEx eAnchorTypeEx,
    char                *pszAnchor,
```

```
int                cbAnchorMax,
BYTE               *pcHTML,
UINT               cbHTML);
typedef BOOL (pascal *KVHTMLCB_GETAUXOUTPUTEX) (
    void            *pCallingContext,
    KVHTMLAnchorTypeEx eAnchorTypeEx,
    char            *pszAnchor,
    KVOutputStream  *pNewOutput);
typedef BOOL (pascal *KVHTMLCB_USERCBEX) (
    void            *pCallingContext,
    char            *psUserCBid,
    KVOutputStream  *pOutput,
    void            *pReserved);
typedef struct tag_KVHTMLCallbacksEx
{
    KVHTMLCB_CONTINUE          Continue;
    KVHTMLCB_GETANCHOREX      GetAnchor;
    KVHTMLCB_GETAUXOUTPUTEX    GetAuxOutput;
    KVHTMLCB_USERCBEX          UserCB;
}
KVHTMLCallbacksEx;
```

Member Descriptions

- The members of this structure are pointers to the functions described in [HTML Export API Callback Functions, on page 187](#).
- If `GetAuxOutput()` is NULL, the `pszDefaultOutputDirectory` member of the instance of `KVHTMLOptionsEx` is used as the base storage location for auxiliary output files. If `pszDefaultOutputDirectory` is also NULL, auxiliary files are placed in the current working directory. See [KVHTMLOptionsEx, on page 208](#).

KVHTMLHeadingInfo

This structure defines how HTML Export creates heading information based on the source document's content and attributes. Source text is converted to a heading and included in the table of contents if

- it meets *all* the criteria defined by this structure, and
- the `headingCreateType` member of `KVHTMLTOCOptions` is set to allow automatic heading generation.

HTML Export evaluates the text against each member in the order in which the members appear below.

See [KVHTMLTOCOptions, on page 222](#) for more information on automatic generation of headings.

When you convert PDF files to HTML by using the default reader, `pdfsr`, the table of contents is generated from "bookmarks" within the PDF file. This structure is not used. The table of contents appear either at the beginning of the HTML file or in a separate frame.

```
typedef struct tag_KVHTMLHeadingInfo
{
    int        minParaLen;
    int        maxParaLen;
    int        fontSizeMin;
    int        fontSizeMax;
    BOOL       bMustBeBold;
    BOOL       bMustBeItalic;
    BOOL       bMustBeUnderlined;
    BOOL       bNonZeroIndent;
    BOOL       bNoTabs;
    BOOL       bNoMultiSpaces;
    int        mSpaceBefore;
    int        mSpaceAfter;
}
KVHTMLHeadingInfo;
```

Member Descriptions

minParaLen	<p>The minimum number of characters that text in the source document can contain for the text to meet the criteria for heading conversion.</p> <p>This option applies to word processing documents only.</p> <p>The default is 3 for heading levels 1 to 3.</p>
maxParaLen	<p>The maximum number of characters that text in the source document can contain for the text to meet the criteria for heading conversion.</p> <p>This option applies to word processing documents only.</p> <p>The default is 80 for heading levels 1 to 3.</p>
fontSizeMin	<p>The minimum font size of text in the source document for the text to meet the criteria for heading conversion.</p> <p>The default is 14 for heading level 1, and 12 for heading levels 2 and 3.</p>
fontSizeMax	<p>The maximum font size of text in the source document for the text to meet the criteria for heading conversion.</p> <p>The default is 20 for heading level 1, and 14 for heading levels 2 and 3.</p>
bMustBeBold	<p>If you set <code>bMustBeBold</code> to <code>TRUE</code>, the text in the source document must be bold to meet the criteria for heading conversion.</p> <p>The default is <code>TRUE</code> for heading levels 1 and 2, and <code>FALSE</code> for heading level 3.</p>
bMustBeItalic	<p>If you set <code>bMustBeItalic</code> to <code>TRUE</code>, the text in the source document must be italic to meet the criteria for heading conversion.</p> <p>The default is <code>FALSE</code>.</p>
bMustBeUnderlined	<p>If you set <code>bMustBeUnderlined</code> to <code>TRUE</code>, the text in the source document must</p>

	be underlined to meet the criteria for heading conversion. The default is FALSE.
bNonZeroIndent	If you set bNonZeroIndent to TRUE, the text in the source document must be indented to meet the criteria for heading conversion. If you set bNonZeroIndent to FALSE, the text must be aligned left. The default is FALSE.
bNoTabs	If you set bNoTabs to TRUE, the text in the source document must <i>not</i> contain tabs to meet the criteria for heading conversion. The default is FALSE.
bNoMultiSpaces	If you set bNoMultiSpaces to TRUE, the text in the source document must <i>not</i> contain two or more contiguous white spaces to meet the criteria for heading conversion. The default is FALSE.
mSpaceBefore	The amount of space in TWIPS (20th of a point) that must come before a paragraph in the source document for the text to meet the criteria for heading conversion. If -1 is used, the amount of space before the paragraph is not considered in the heading generation. The default is 0.
mSpaceAfter	The amount of space in TWIPS (20th of a point) that must follow a paragraph in the source document for the text to meet the criteria for heading conversion. If -1 is used, the amount of space after the paragraph is not considered in the heading generation. The default is 0.

KVHTMLHighlight

This structure defines the search terms that are found and highlighted in the HTML output. It is initialized by calling `KVHTMLSetHighlight()` and is defined in `kvtypes.h`. See [KVHTMLSetHighlight\(\)](#), on page 181.

```
typedef struct tag_KVHTMLHighlight
{
    KVStructHeader;
    char          **pPHTerms;
    int           nSize;
    KVCharset     eCharset;
    char          *pHLStart;
    char          *pHLEnd;
    BOOL          bMatchCase;
    int           nReserved;
    void          *pReserved;
```

```
}
KVHTMLHighlight;
```

Member Descriptions

KVStructHeader	The KeyView version of the structure. See KVStructHead , on page 196.
ppHLTerms	An array of terms to be found and highlighted in the HTML output.
nSize	The number of terms to be found and highlighted in the HTML output.
eCharset	<p>The character set of the term. The available character sets are enumerated in KVCharSet in kvtypes.h. See Convert Character Sets, on page 76.</p> <p>When eCharset is specified, the term is converted from this character set to the output character set when the character sets are different. If eCharset is not specified, the term's character set is assumed to be the output character set.</p>
pHLStart	<p>The start tag that specifies the text attributes used to highlight the text string. For example, you could specify</p> <pre></pre>
pHLEnd	<p>The end tag used to close the highlighting start tag. The end tag for the example above would be </p>
bMatchCase	This Boolean applies only to searches on documents with a target character set of 1252. If this Boolean is set, the text search is case sensitive. By default, the text search is case insensitive.
nReserved	Reserved for future use.
pReserved	Reserved for future use.

KVHTMLInterfaceEx

NOTE:

This structure has been superseded by [KVHTMLInterfaceEx2](#); KVHTMLInterfaceEx2 should be used instead of KVHTMLInterfaceEx.

The members of this structure are pointers to the API functions described in [HTML Export API Functions](#), on page 154.

```
typedef void* (pascal *KVHTML_INITEX) (
    KVMemoryStream      *pMemAllocator,
    char                 *pszKeyViewDir,
    char                 *pszDataFile,
    KVErrCode            *pError,
    DWORD                dWord);
typedef void (pascal *KVHTML_SHUTDOWN)(void*);
typedef BOOL (pascal *KVHTML_CONVERT_STREAMEX) (
```

```
void                *pContext,
void                *pCallingContext,
KVInputStream       *pInput,
KVOutputStream      *pOutput,
KVHTMLTemplateEx    *pTemplatesEx,
KVHTMLOptionsEx     *pOptionsEx,
KVHTMLTOCOptions    *pTOCCreateOptions,
KVHTMLCallbacksEx   *pCallbacksEx,
BOOL                bIndex,
KVErrCode           *pError);
typedef char** (pascal *KVHTML_GET_FILE_LIST)(
    void            *pContext,
    int             *pnSize );
typedef BOOL (pascal *KVHTML_GET_STREAM_INFO)(
    void            *pContext,
    KVInputStream   *pInput,
    KVStreamInfo    *pStreamInfo );
typedef BOOL (pascal *KVHTML_GET_ANCHOREX) (

    KVHTML_VALIDATE_TEMPLATE     fpValidateTemplate;
}

    KVHTMLInterfaceEx;
```

Member Descriptions

The members of this structure are function pointers to the functions described in [HTML Export API Functions, on page 154](#).

KVHTML_LANGUAGE_ID and KVHTML_VALIDATE_TEMPLATE are currently not implemented.

KVHTMLInterfaceEx2

The members of this structure are pointers to the API functions described in [HTML Export API Functions, on page 154](#).

This structure supersedes KVHTMLInterfaceEx. KVHTMLInterfaceEx2 should be used instead of KVHTMLInterfaceEx.

Compared to KVHTMLInterfaceEx, KVHTMLInterfaceEx2 adds two functions for checking error codes, and allows for binary compatible extensibility in future releases.

```
typedef void* (pascal *KVHTML_INITEX) (
    KVMemoryStream *pMemAllocator,
    char *pszKeyViewDir,
    char *pszDataFile,
    KVErrCode *pError,
```

```
        DWORD dWord);
typedef void (pascal *KVHTML_SHUTDOWN)(void*);
typedef BOOL (pascal *KVHTML_CONVERT_STREAMEX) (
    void *pContext,
    void *pCallingContext,
    KVInputStream *pInput,
    KVOutputStream *pOutput,
    KVHTMLTemplateEx *pTemplatesEx,
    KVHTMLOptionsEx *pOptionsEx,
    KVHTMLTOCOptions *pTOCCreateOptions,
    KVHTMLCallbacksEx *pCallbacksEx,
    BOOL bIndex,
    KVErrCode *pError);
typedef char** (pascal *KVHTML_GET_FILE_LIST)(
    void *pContext,
    int *pnSize );
typedef BOOL (pascal *KVHTML_GET_STREAM_INFO)(
    void *pContext,
    KVInputStream *pInput,
    KVStreamInfo *pStreamInfo );
typedef BOOL (pascal *KVHTML_GET_ANCHOREX) (
    void *pCallingContext,
    KVHTMLAnchorTypeEx eAnchorTypeEx,
    char *pszAnchor,
    int cbAnchorMax,
    BYTE *pcHTML,
    UINT cbHTML);
typedef BOOL (pascal *KVHTML_INPUTSTREAM_CREATE) (
    void *pContext,
    char *pszFileName,
    KVInputStream *pInput);
typedef BOOL (pascal *KVHTML_INPUTSTREAM_FREE) (
    void *pContext,
    KVInputStream *pInput);
typedef BOOL (pascal *KVHTML_OUTPUTSTREAM_CREATE) (
    void *pContext,
    char *pszFileName,
    KVOutputStream *pOutput );
typedef BOOL (pascal *KVHTML_OUTPUTSTREAM_FREE)(
    void *pContext,
    KVOutputStream *pOutput );
typedef KVLanguageID (pascal *KVHTML_LANGUAGE_ID)(void *pContext);
typedef BOOL (pascal *KVHTML_GET_SUMMARY_INFO)(
    void *pContext,
    KVInputStream *pInput,
    KVSummaryInfoEx *pSummary,
    BOOL bFree );
typedef BOOL (pascal *KVHTML_SET_STYLE_MAPPING) (

KVHTMLOptionsEx

This structure defines the options that control the HTML markup written in response to the general style and attributes (font, color, and so on) of the document. The structure is initialized by calling the function `fpConvertStream()` or `KVHTMLConvertFile()`.

```

typedef struct tag_KVHTMLOptionsEx
{
    KVCharSet                OutputCharSet;
    BOOL                     bUseDocumentColors;
    BOOL                     bUseDocumentFontInfo;
    BOOL                     bSupportFontFace;
    BOOL                     bSupportUserFontSizeMapping;
}

```

```

    KVFontSizeMap          FontSizeMap;
    BOOL                   bDisplayRelativeFontSize;
    BOOL                   bSupportRFC1942_cols;

Member Descriptions

OutputCharSet

The character set to use for textual output. The available character sets are enumerated in KVCharSet in kvtypes.h. See [Convert Character Sets, on page 76](#)

	<p>To make sure that the character set defined here is used, you must set <code>bForceOutputCharSet</code> to <code>TRUE</code>.</p> <p>The default is <code>KVCS_UNKNOWN</code>.</p>
<code>bUseDocumentColors</code>	<p>Set <code>bUseDocumentColors</code> to <code>TRUE</code> to retain the color attributes information contained in the source document. If you set <code>bUseDocumentColors</code> to <code>FALSE</code>, no color attributes appear in the <code></code> tags of the output.</p> <p>The default is <code>FALSE</code>.</p>
<code>bUseDocumentColors</code>	<p>Set <code>bUseDocumentColors</code> to <code>TRUE</code> to retain the font information contained in the source document. If you set <code>bUseDocumentColors</code> to <code>FALSE</code>, no font information appears in the <code></code> tags in the output.</p> <p>The default is <code>FALSE</code>.</p>
<code>bSupportFontFace</code>	<p>Set <code>bSupportFontFace</code> to <code>TRUE</code> to retain the font face information contained in the source document. If you set <code>bSupportFontFace</code> to <code>FALSE</code>, no <code>FACE</code> attributes appear in the <code></code> tags of the HTML output.</p> <p>This applies only when you set <code>eStyleSheetType</code> to <code>STYLESHEET_DISABLED</code>. The default is <code>TRUE</code>.</p>
<code>bSupportUserFontSizeMapping</code>	<p>Set <code>bSupportUserFontSizeMapping</code> to <code>TRUE</code> to use the font sizes specified in the <code>FontSizeMap</code>. If you set <code>bSupportUserFontSizeMapping</code> to <code>FALSE</code>, HTML Export uses default size attributes.</p> <p>This applies only when you set <code>eStyleSheetType</code> to <code>STYLESHEET_DISABLED</code>. The default is <code>FALSE</code>.</p>
<code>FontSizeMap</code>	<p>The font sizes to which the HTML tags <code></code> through <code></code> correspond. If <code>bSupportUserFontSizeMapping</code> is <code>FALSE</code>, this member can be left blank.</p> <p>See the Discussion section for more information.</p>
<code>bDisplayRelativeFontSize</code>	<p>Set <code>bDisplayRelativeFontSize</code> to <code>TRUE</code> to use relative font size tags in the HTML output. For example, the tag <code></code> adds one to the base font size, which is normally three.</p> <p>The default is <code>FALSE</code>.</p>
<code>bSupportRFC1942_cols</code>	<p>Set <code>bSupportRFC1942_cols</code> to <code>TRUE</code> to include <code>cols=integer</code> specifications in the <code><table></code> tags of the HTML output.</p> <p>The default is <code>TRUE</code>.</p>
<code>bNbspEmptyCells</code>	<p>Set <code>bNbspEmptyCells</code> to <code>TRUE</code> to include a non-breaking space (<code><td>&nbsp;</td></code>) in the markup for empty table cells in the source document. If you set <code>bNbspEmptyCells</code> to <code>FALSE</code>, <code><td></td></code> is generated for empty table cells.</p>

	<p>This option applies to word processing documents and spreadsheets only.</p> <p>The default is TRUE.</p>
SATableBorder	<p>Specifies whether table borders are based on the setting in the source document, are always on, or are always off. The options are enumerated in ENSATableBorder in kvtypes.h. See ENSATableBorder, on page 227.</p> <p>This option applies to word processing documents only.</p> <p>The default is SA_BaseOnDocument.</p>
nTableBorderWidth	<p>Sets the width of the table border in pixels.</p> <p>This option applies to word processing documents only.</p> <p>The default is 1.</p>
pszBaseURL	<p>The base URL that replaces the \$BASE token in the HTML output. See \$BASE, on page 359.</p> <p>The default is NULL.</p>
pszMainURL	<p>The URL that replaces the \$MAINURL token in the HTML output. See \$MAINURL, on page 359.</p> <p>The default is NULL.</p>
pszDefaultOutputDirectory	<p>The default output directory for auxiliary files created during the conversion.</p> <p>The default is NULL, and the files are placed in the directory in which your application is running.</p>
pszPicPath	<p>The output directory for graphics created during the conversion. If specified, this member can also be used by the callback functions KVHTMLGetAnchorEx and KVHTMLGetAuxOutputEx.</p> <p>This option applies to word processing documents only.</p> <p>The default is NULL, and the files are placed in the directory in which your application is running.</p>
pszPicURL	<p>The URL of the picture files created from embedded graphics in the source document. To specify a complete image source, this element must be combined with pszAnchor of the GetAnchor() callback function. See GetAnchor(), on page 188.</p> <p>For example, setting pszPicURL to <code>../cgi-bin/</code> and setting pszAnchor to <code>pic.jpg</code> results in the following markup:</p> <pre></pre> <p>This element applies to word processing documents only. The default is NULL.</p>
bRemoveFileNameSpaces	<p>Set bRemoveFileNameSpaces to TRUE to remove spaces from</p>

generated output file names.

The default is FALSE.

`bRasterizeFiles`

Set `bRasterizeFiles` to TRUE to rasterize slides from presentations into single images. For this setting to take effect, you must set the [bNoPictures, on page 215](#) member to FALSE. The format the images are converted to is determined by the [OutputRasterGraphicType, below](#) member.

Set `bRasterizeFiles` to FALSE to convert the text in slides to HTML. When you set this member to FALSE, images do not appear in the HTML output.

The default is FALSE.

NOTE:

When `bRasterizeFiles` is FALSE, the export process uses the ordering in the file to produce the output, which does not necessarily match the logical reading order for the presentation. To use a logical reading order instead, you can set the `LogicalOrder` parameter in the [Options] section of `formats_e.ini`. See [Convert Presentation Files, on page 103](#).

`OutputRasterGraphicType`

The output format of rasterized embedded graphics. There are six options enumerated in `KVHTMLGraphicType` in `kvhtml.h`. See [KVHTMLGraphicType, on page 235](#).

The default is `KVGFX_JPEG`.

`OutputVectorGraphicType`

The output format of vector graphics. The options are enumerated in `KVHTMLGraphicType` in `kvhtml.h`. See [KVHTMLGraphicType, on page 235](#). For more information on displaying vector graphics on UNIX or Linux, see [Display Vector Graphics on UNIX and Linux, on page 84](#).

The default is `KVGFX_JPEG`.

`cxVectorToRasterXRes`

Specifies the horizontal resolution when converting presentation files and vector graphics. This is set in conjunction with `cyVectorToRasterYRes`. For more information, see [Set the Resolution of Presentations and Vector Graphics, on page 216](#).

The default value is 0, which means the original resolution is retained.

`cyVectorToRasterYRes`

Specifies the vertical resolution when converting presentation files and vector graphics. This is set in conjunction with `cxVectorToRasterXRes`. For more information, see [Set the Resolution of Presentations and Vector Graphics, on page 216](#).

The default value is 0, which means the original resolution is retained.

bGenerateURLs	<p>Set bGenerateURLs to TRUE to add anchor tags (<a ...>) to text starting with "www", "http:" or "file:".</p> <p>This option applies to word processing documents only. The default is FALSE.</p>
lcbMaxMemUsage	<p>The maximum memory allocated dynamically for token buffers during file processing. If this maximum is reached, Export performs a swap-to-disk operation internally, and then reuses the memory blocks. Export maintains an internal minimum memory size.</p> <p>This option applies to word processing or text documents only. The default is LONG_MAX. The unit is in bytes.</p>
bSupportColumnHeadings	<p>Set bSupportColumnHeadings to TRUE to include column headings from the source spreadsheet in the output.</p> <p>This option applies to spreadsheets only. The default is FALSE.</p>
bSupportRowHeadings	<p>Set bSupportRowHeadings to TRUE to include row headings from the source spreadsheet in the output.</p> <p>This option applies to spreadsheets only. The default is FALSE.</p>
bSupportCellSpan	<p>Set bSupportCellSpan to TRUE to include colspan="n" markup in the output. If text in the source document spans across empty columns, and bSupportCellSpan is enabled, the text is output across columns in the HTML. If this option is disabled, text that spans across columns is output in a single cell.</p> <p>This option applies to spreadsheets only. The default value is FALSE.</p>
bSupportRowSpan	<p>Set bSupportRowSpan to TRUE to include row span data from the source spreadsheet in the output.</p> <p>This option applies to spreadsheets only. The default value is FALSE. Currently not supported.</p>
bSupportColumnWidth	<p>Set bSupportColumnWidth to TRUE to include column width data from the source document in the output.</p> <p>This option applies to spreadsheets only. The default value is FALSE.</p>
bRemoveEmptyColumns	<p>Set bRemoveEmptyColumns to TRUE to remove columns that do not contain text or color. To remove empty columns, you must set bSupportCellSpan to FALSE.</p> <p>This option applies to spreadsheets only. The default is FALSE.</p>
bRemoveEmptyRows	<p>Set bRemoveEmptyRows to TRUE to remove empty rows that do not contain text or color. This option applies to spreadsheets only.</p> <p>The default is FALSE.</p>
nRowsBeforeSplit	<p>The approximate number of spreadsheet rows to be processed</p>

before splitting a table. This helps to prevent large spreadsheet tables from occurring in a single document, which can cause speed and processing problems for the browser.

This option applies to spreadsheets only. The default is 0.

OutputLanguageID The language for the textual output of language-specific data such as time and date. `OutputLanguageID` must be in the system locale. If `OutputLanguageID` is invalid or not supplied, the system default is used. Language IDs are defined in `KVLanguageID` in `kvtypes.h`.

The default is `Language_UNKNOWN`.

eStyleSheetType One of the enumerated options for processing style sheet information. The options are defined in `KVHTMLStyleSheetType` in `kvhtml.h`. See [KVHTMLStyleSheetType, on page 233](#).

`STYLESHEET_DISABLED`—Disables Cascading Style Sheet (CSS) formatting.

`CSS_INLINE`—Enables CSS formatting, and adds style sheet information inline to the HTML output file.

`CSS_TOFILE`—Enables CSS formatting, and generates an external file or uses an existing external file, which is referenced in a `<link...>` element.

The default is `STYLESHEET_DISABLED`.

bTabsToTables Set `bTabsToTables` to `TRUE` to convert tabbed columns to tables. This option applies to word processing documents only.

When you use `bTabsToTables`, the original font in the cells is not maintained. The `bTabsToTables` option is intended for use on plain text files. Its purpose is to make the text more readable when viewed in a browser. Font information is not written into the table cells that are generated. Instead, the default font of the browser is used.

The default is `FALSE`.

bForceOutputCharSet Set `bForceOutputCharSet` to `TRUE` to use the output character set specified in `OutputCharSet`, regardless of the internal document information or the source character set specified by `eSrcCharSet`. Forcing a character set to `KVCS_UNKNOWN` is always ignored. See [Convert Character Sets, on page 76](#).

The default is `FALSE`.

bEnableEmptyRows Set `bEnableEmptyRows` to `TRUE` to display empty rows in spreadsheets. If you set `bEnableEmptyRows` to `FALSE`, empty rows are not displayed. This option applies only to 20 or more consecutive empty rows.

This option applies to spreadsheets only. The default is `FALSE`.

cReplaceChar	<p>The character used when a character in the source document's character set cannot be mapped to the output character set.</p> <p>The default replacement character is a question mark (?).</p>
cRedact	<p>The character used to replace text that is designated through style mapping to be omitted from the output. This functionality is useful when you need to hide confidential or sensitive information.</p> <p>The specified character is used for all text that is mapped to a style processed with the KVSTYLE_REDACT flag (defined in kvtypes.h). See Map Styles, on page 81.</p> <p>This option applies to word processing documents only. The default replacement character is "X".</p>
eSrcCharSet	<p>Specifies the source character set of the document. The available character sets are enumerated in KVCharSet in kvtypes.h. See Convert Character Sets, on page 76.</p> <p>To make sure that the character set defined here is used, you must set bForceSrcCharSet to TRUE.</p> <p>The default is KVCS_UNKNOWN.</p>
bForceSrcCharSet	<p>Set bForceSrcCharSet to TRUE to use the source character set specified in eSrcCharSet, regardless of the internal document information. See Convert Character Sets, on page 76.</p> <p>Forcing a character set to KVCS_UNKNOWN is always ignored.</p> <p>The default is FALSE.</p>
nCompressionQuality	<p>Controls the output quality of graphics that support compression quality (for example, JPEG). A value of 0 means default quality (85 compression); 1 is the lowest quality (highest compression and therefore the smallest file size); 100 is the highest quality (no compression and therefore the largest file size).</p> <p>This option applies to word processing documents only. The default is 0.</p>
bNoPictures	<p>This member is only available in the structure in the template files. It is not part of the structure in the API.</p> <p>If you set bNoPictures to TRUE, embedded graphics in a document are not generated as separate files, image tags are not included in the output, and verbose markup is generated. Because graphics are not generated, the conversion is faster.</p> <p>If you set bNoPictures to FALSE, embedded graphics in a document are regenerated as separate files, stored in the output directory, and image tags are included in the output.</p> <p>This member is passed to the blindex argument of the fpConvertStream() or KVHTMLConvertFile() functions.</p>

The default is FALSE.

Discussion

- A pointer to this structure is passed as an argument to `fpConvertStream()` or `KVHTMLConvertFile()`. If the pointer to the structure is not NULL, the values of the members specified in the structure are used. If the pointer to the structure is NULL, the default values are used.
- `bNoPictures` is similar to the `KVCFG_BLANKPICTURE` flag in the call to `KVHTMLConfig()`. Unlike `bNoPictures`, the `KVCFG_BLANKPICTURE` flag generates image tags with an empty `src` attribute. [KVHTMLConfig\(\), on page 170](#).
- To output graphics for presentations, you must set `bNoPictures` to FALSE, and set [bRasterizeFiles](#) to TRUE.
- The values in [FontSizeMap, on page 210](#) indicate the range for the HTML tag ``. For example, if you specify 8, 10, 12, 14, 18, and 24:
 - font size ≤ 8 in the source document is mapped to `` in the output HTML
 - else, font size ≤ 10 in the source document is mapped to `` in the output HTML
 - else, font size ≤ 12 in the source document is mapped to `` in the output HTML
 - else, font size ≤ 14 in the source document is mapped to `` in the output HTML
 - else, font size ≤ 18 in the source document is mapped to `` in the output HTML
 - else, font size ≤ 24 in the source document is mapped to `` in the output HTML
 - font size > 24 in source the document is mapped to `` in the output HTML

When the HTML output is viewed, the browser maps `` to a specific font size.

Set the Resolution of Presentations and Vector Graphics

The [cxVectorToRasterXRes](#) and [cyVectorToRasterYRes](#) members are set in conjunction to specify the resolution (width and height) at which presentation files and vector graphics are converted.

You can specify the resolution as an absolute size in pixels, or as a proportion of the original size.

KeyView always maintains the aspect ratio of the original graphic and does not increase the resolution. If you set values that would enlarge a graphic, KeyView only changes the size of the HTML element.

To set the resolution in pixels

To specify the resolution in pixels, specify the width ([cxVectorToRasterXRes](#)) and/or height ([cyVectorToRasterYRes](#)).

To export the largest image that fits within a bounding box, without changing the original aspect ratio, set both the width and height. For example, to export the largest image that fits in an 800x500 bounding box:

```
cxVectorToRasterXRes=800  
cyVextorToRasterYRes=500
```

Alternatively you can fix one of the dimensions. Set one value and set the other to zero. For example, to export images with a height of 1500 pixels and whatever width is necessary to maintain the original aspect ratio:

```
cxVectorToRasterXRes=0  
cyVextorToRasterYRes=1500
```

The maximum size permitted for either dimension is 4000 pixels.

To set the resolution proportionally

To set the resolution proportionally, set `cxVectorToRasterXRes` to a negative value. A negative value represents a percentage of the original resolution. Set `cyVectorToRasterYRes` to 0 (zero). Negative (percentage) values for `cyVectorToRasterYRes` are ignored.

The following example exports a graphic at 50 percent of its original resolution:

```
cxVectorToRasterXRes=-50  
cyVectorToRasterYRes=0
```

KVHTMLTemplateEx

This structure defines the overall framework of the HTML output. Members in this structure define the HTML markup written at specific points in the output stream. The pointers contain HTML markup that might include embedded KeyView tokens. See [Export Tokens, on page 359](#) for more information on tokens. The structure is initialized by calling the `fpConvertStream()` or `KVHTMLConvertFile()` function. See [fpConvertStream\(\), on page 156](#) or [KVHTMLConvertFile\(\), on page 177](#).

```
typedef struct tag_KVHTMLTemplateEx  
{  
    char        *pszMainTop;  
    char        *pszMainBottom;  
    char        *pszFirstH1Start;  
    char        *pszFirstH1End;  
    char        *pszMiddleH1Start;  
    char        *pszMiddleH1End;  
    char        *pszLastH1Start;  
    char        *pszLastH1End;  
    char        *pszH[2..6]HTML;  
    char        *pszTOCH[1..6]Start;  
    char        *pszTOC_H[1..6];  
    char        *pszTOCH[1..6]End;  
    char        *pszXFile;  
    char        *pszStartBlock;  
    char        *pszEndBlock;  
    BOOL        bPutBlocksInSeparateFiles;  
    BOOL        bHardPageMakesNewBlock  
    long        lcbBlockSize;  
    char        *pszChunkTemplate;  
    char        *pszTableHTML;  
    BOOL        bTableHTMLForSpreadsheetOnly;
```

```
    char        *pszUserSummary;  
    char        *pszXStartBlock;  
    char        *pszXEndBlock;  
    char        *pszTOCH[1..6]LeafNode;  
}  
KVHTMLTemplateEx;
```

Member Descriptions

pszMainTop	<p>The markup and tokens inserted at the beginning of the main HTML file. Most of the template files feature <code><meta></code> tags with tokens that store the input document's metadata. This member should at least contain the <code><html></code> and <code><body></code> tags. For frame-style output, this member must include the <code><frame></code> tag.</p> <p>The default is NULL.</p>
pszMainBottom	<p>The markup and tokens inserted at the end of the main HTML file. This member should at least contain the <code></html></code> and <code></body></code> tags, and should close the elements that are opened by <code>pszMainTop</code>.</p> <p>The default is NULL.</p>
pszFirstH1Start	<p>The markup and tokens inserted at the beginning of the first created H1 HTML block (that is, the block associated with the first H1 table of contents entry).</p> <p>The default is NULL.</p>
pszFirstH1End	<p>The markup and tokens inserted at the end of the first created H1 HTML block (that is, the block associated with the first H1 table of contents entry).</p> <p>The default is NULL.</p>
pszMiddleH1Start	<p>The markup and tokens inserted at the beginning of those H1 HTML blocks that are neither the first nor the last H1 blocks created (that is, blocks associated with all but the first and last H1 table of contents entries).</p> <p>The default is NULL.</p>
pszMiddleH1End	<p>The markup and tokens inserted at the end of those H1 HTML blocks that are neither the first nor the last H1 blocks created (that is, blocks associated with all but the first and last H1 table of contents entries).</p> <p>The default is NULL.</p>
pszLastH1Start	<p>The markup and tokens inserted at the beginning of the last created H1 HTML block (that is, the block associated with the last H1 table of contents entry).</p>

	<p>The default is NULL.</p>
pszLastH1End	<p>The markup and tokens inserted at the end of the last created H1 HTML block (that is, the block associated with the last H1 table of contents entry).</p> <p>The default is NULL.</p>
pszH[2..6]HTML	<p>The markup and tokens inserted in an HTML block for heading levels 2 through 6.</p> <p>The default is NULL.</p>
pszTOCH[1..6]Start	<p>The markup and tokens inserted at the beginning of a table of contents block for heading levels 1 through 6 entries. For example:</p> <pre><ol type="I"> <ol type="1"> <ol type="i"></pre> <p>The default is NULL.</p>
pszTOC_H[1..6]	<p>The markup and tokens required to process the table of contents entries for heading levels 1 through 6. For example:</p> <pre>\$TOCTE</pre> <p>The default is NULL.</p>
pszTOCH[1..6]End	<p>The markup and tokens inserted at the end of a table of contents block for heading levels 1 through 6 entries. For example:</p> <pre></pre> <p>The default is NULL.</p>
pszXFile	<p>The markup and tokens generated and placed in an extra HTML file. This file holds content from the source document. For example, it could contain the table of contents (using the \$TOC token), which could then be displayed in an HTML frame. To process this file, you would use the \$XANCHOR token.</p> <p>For example, if the extra file contains the table of contents in frame-based HTML, set pszXFile=\$TOC and place the following HTML markup in the pszMainTop element:</p> <pre><frame src="\$XANCHOR" name="left" scrolling="auto" target="right"></pre> <p>See Export Tokens, on page 359 for more information on Export tokens.</p> <p>The default is NULL.</p>
pszStartBlock	<p>The markup and tokens inserted at the beginning of each block created as a result of lcbBlockSize or</p>

	<p><code>bHardPageMakesNewBlock</code>.</p> <p>The default is NULL.</p>
<code>pszEndBlock</code>	<p>The markup and tokens inserted at the end of each block created as a result of the of <code>lcbBlockSize</code> or <code>bHardPageMakesNewBlock</code>.</p> <p>The default is NULL.</p>
<code>bPutBlocksInSeparateFiles</code>	<p>Set <code>bPutBlocksInSeparateFiles</code> to TRUE to create a separate HTML file for each heading level 1 block. Each new block uses the markup defined in <code>pszStartBlock</code> and <code>pszEndBlock</code>. If you set <code>bPutBlocksInSeparateFiles</code> to FALSE, each heading level 1 block is placed sequentially in the same file after the initial markup is written.</p> <p>The default is FALSE.</p>
<code>bHardPageMakesNewBlock</code>	<p>Set <code>bHardPageMakesNewBlock</code> to TRUE to have hard page breaks in the source document generate new HTML files during the conversion process. The bPutBlocksInSeparateFiles, above member must also be set to TRUE, and the pszChunkTemplate, below member must specify a table of contents entry for the new file.</p> <p>This option applies to word processing documents and spreadsheets only. Page boundaries in PDF documents are considered page breaks.</p> <p>The default is FALSE.</p>
<code>lcbBlockSize</code>	<p>The maximum size (in bytes) of heading level 1 HTML output files. This number is used as a guideline and can be exceeded to break content at a logical location. This setting is not used when exporting spreadsheets.</p> <p>The default is 0. This means that the size is undefined and unlimited.</p>
<code>pszChunkTemplate</code>	<p>If a heading level 1 HTML block is subdivided into separate files because the block exceeds the size limitations specified in <code>lcbBlockSize</code>, or <code>bHardPageMakesNewBlock</code> is set, this member defines the table of contents entry for the new file.</p> <p>The page number can be included in the table of contents entry by inserting the <code>\$SPLITBLOCKNUMBER</code> token. For example:</p> <p>Page <code>\$SPLITBLOCKNUMBER</code></p> <p>The default is NULL.</p>
<code>pszTableHTML</code>	<p>Specifies the markup (no tokens) inserted at the beginning of each table created during the conversion process. If you set <code>pszTableHTML</code>, table cell color and border information from the document is ignored. This is used in conjunction with</p>

	<p><code>bTableHTMLForSpreadsheetOnly</code> to control the look of generated spreadsheets.</p> <p>For example, to center the table, set the background color to teal, and set the border width to 13, use:</p> <pre>pszTableHTML=<table bgcolor="teal" border="13" align="center"></pre> <p>The default is NULL.</p>
<code>bTableHTMLForSpreadsheetOnly</code>	<p>If set to TRUE, <code>bTableHTMLForSpreadsheetOnly</code> controls how spreadsheets are displayed in the output. If set to FALSE, cell color and border information from the source document is used. Use this member in conjunction with <code>pszTableHTML</code>.</p> <p>The default is FALSE.</p>
<code>pszUserSummary</code>	<p>The markup and tokens generated when the tokens <code>\$USERSUMMARY</code> or <code>\$SUMMARY</code> are used. For example:</p> <pre><meta name="\$NAME" content="\$CONTENT" /></pre> <p>The default is NULL.</p>
<code>pszXStartBlock</code>	<p>The markup and tokens inserted at the beginning of each HTML block generated by the <code>\$XANCHOR</code> token. If either this member or <code>pszXEndBlock</code> is defined, both <code>pszStartBlock</code> and <code>pszEndBlock</code> are ignored. See Export Tokens, on page 359 for more information on <code>\$XANCHOR</code>.</p> <p>The default is NULL.</p>
<code>pszXEndBlock</code>	<p>The markup and tokens inserted at the end of each HTML block generated by the <code>\$XANCHOR</code> token. If either this member or <code>pszXStartBlock</code> is defined, both <code>pszStartBlock</code> and <code>pszEndBlock</code> are ignored. See Export Tokens, on page 359 for more information on <code>\$XANCHOR</code>.</p> <p>The default is NULL.</p>
<code>pszTOCH[1..6]LeafNode</code>	<p>The markup that replaces <code>pszTOC_H[1..6]</code> entries for leaf nodes in the table of contents. A leaf node is a node that has no children.</p> <p>The default is NULL.</p>

Discussion

A pointer to this structure is passed as an argument to `fpConvertStream()` and `KVHTMLConvertFile()`. If the pointer to the structure is not NULL, the values of the members specified in the structure are used. If the pointer to the structure is NULL, the default values are used.

KVHTMLTOCOptions

This structure defines whether a heading is included in the table of contents. Source text is converted to a heading in the HTML output if

- it meets *all* the criteria defined by the members of KVHTMLHeadingInfo (see [KVHTMLHeadingInfo](#), on page 201), and
- the headingCreateType member of KVHTMLTOCOptions is set to allow automatic heading generation.

The structure is initialized by calling the fpConvertStream() or KVHTMLConvertFile() function. See [fpConvertStream\(\)](#), on page 156 or [KVHTMLConvertFile\(\)](#), on page 177.

When PDF files are converted to HTML by using the default reader, pdfsr, the table of contents is generated from "bookmarks" within the PDF file. This structure is not used.

```
Typedef struct tag_KVHTMLTOCOptions
{
    BOOL                bAllowHeadingsInTables;
    KVHeadingCreateOptions headingCreateType;
    KVHTMLHeadingInfo   *pH1;
    KVHTMLHeadingInfo   *pH2;
    KVHTMLHeadingInfo   *pH3;
    KVHTMLHeadingInfo   *pH4;
    KVHTMLHeadingInfo   *pH5;
    KVHTMLHeadingInfo   *pH6;
}
KVHTMLTOCOptions;
```

Member Descriptions

bAllowHeadingsInTables	<p>This option determines if the text in tables is considered for automatic heading generation. If you set bAllowHeadingsInTables to TRUE, the text in tables is included in the determination of headings and table of contents entries.</p> <p>This option applies to word processing documents and spreadsheets only.</p> <p>The default is FALSE.</p>
headingCreateType	<p>This option determines how HTML Export subdivides the source document into table of contents entries. This should be set to one of the two options that are enumerated in KVHeadingCreateOptions in kvhtml.h. See KVHeadingCreateOptions, on page 236.</p> <p>The determination of table of contents entries is based on whether the source document contains <i>heading styles</i> or whether <i>text attributes</i> conform to the criteria defined in the KVHTMLHeadingInfo structure. See KVHTMLHeadingInfo, on page 201.</p>

Heading styles are predefined style tags, such as "Heading 1" and "Heading 2" tags in a Microsoft Word document. Text attributes are bold, underlined, italic, and so on.

This option applies to word processing documents only.

The default is KVCS_DocHeadingsOnly.

KVHTMLHeadingInfo

A pointer to the KVHTMLHeadingInfo structure.
See [KVHTMLHeadingInfo](#), on page 201.

When the table of contents entries are not based on the source documents heading styles, the table of contents entries are determined by whether text attributes (such as bold, underlined, and italic text) in the source document meet all the criteria defined in KVHTMLHeadingInfo.

Discussion

A pointer to this structure is passed as an argument to `fpConvertStream()` and `KVHTMLConvertFile()`. If the pointer to the structure is not NULL, the values of the members specified in the structure are used. If the pointer to the structure is NULL, the default values are used.

KVRevisionMark

This structure defines the information generated when the revision feature is enabled and how the information is displayed. (see [Include Revision Information](#), on page 86). It defines the following:

- the contents of the `title` attribute for an `<ins>` or `` tag. See [Configure the Revision Title](#), on page 87.
- the style used to display revised text by different reviewers. See [Configure the Revision Style](#), on page 88.
- the revision summary file. See [Generate a Revision Summary](#), on page 88.

```
typedef struct tag_KVRevisionMark
{
    KVStructHeader;
    KV_RM_Title    InsTitle;
    KV_RM_Title    DelTitle;
    char           **ppAuthorStyles;
    int            nAuthorStyles;
    BOOL           bCreateSummary;
    char           *pszRevSumStartBlock;
    char           *pszRevSumEndBlock;
    int            nReserved;
    void           *pReserved;
}
KVRevisionMark;
```

Member Description

KVStructHeader	The KeyView version of the structure. See KVStructHead , on page 196.
InsTitle	The prefix and revision information for the <ins> tag, as defined by the KV_RM_TITLE structure in kvtypes.h. See KV_RM_Title , below.
DelTitle	The prefix and revision information for the tag, as defined by the KV_RM_TITLE structure in kvtypes.h. See KV_RM_Title , below.
ppAuthorStyles	The HTML style you want applied to the revised content for a particular reviewer.
nAuthorStyles	The number of HTML styles to be defined.
bCreateSummary	When you set this flag, a revision summary file is created in the directory where the HTML output is generated. The default file name is output_filename.revsum.htm. You can change this file name by using the fpGetAnchor callback function. See GetAnchor() , on page 188.
pszRevSumStartBlock	The markup and tokens inserted at the beginning of the revision summary file.
pszRevSumEndBlock	The markup and tokens inserted at the end of the revision summary file.
nReserved	Reserved for internal use.
pReserved	Reserved for internal use.

KV_RM_Title

This structure defines the contents (prefix, reviewer name, date, and time) of the title attribute for the InsTitle and DelTitle members of KVRevisionMark (see [KVRevisionMark](#), on the previous page).

```
typedef struct tag_KV_RM_Title
{
    RM_Title_Flag    eFlag;
    BYTE             *pPrefix;
    int              nSize;
    KVCharSet        eCharSet;
}
KV_RM_Title;
```

Member Description

eFlag	Specifies whether the reviewer name, date, and time appear in the title attribute. The options are enumerated in RM_Title_Flag in kvtypes.h. See RM_Title_Flag , on page 244.
-------	---

- pPrefix** A pointer to the text string that is prefixed to the `eFlag` value in the `title` attribute of the `<ins>` or `` tags. By default, the string "inserted:" or "deleted:" is the first entry in the attribute.
- nSize** The size of the prefix.
- eCharSet** The character set of the prefix characters. The available character sets are enumerated in `KVCharSet` in `kvtypes.h`. See [Convert Character Sets, on page 76](#).
- If you set `eCharSet` to `KVCS_UNKNOWN`, the character set of the prefix is not converted and the prefix is written directly to the HTML output.

Chapter 11: Enumerated Types

This section provides information on some of the enumerated types used by the HTML Export API.

• Introduction	226
• ENSATableBorder	227
• KVCredKeyType	228
• KVCErrorCode	228
• KVCErrorCodeEx	230
• KVHTMLStyleSheetType	233
• KVHTMLAnchorTypeEx	234
• KVHTMLGraphicType	235
• KVHeadingCreateOptions	236
• KVMetadataType	237
• KVMetaNameType	238
• KVSumInfoType	239
• KVSumType	240
• LPDF_DIRECTION	243
• RM_Title_Flag	244

Introduction

The enumerated types are in `adinfo.h`, `kvtypes.h`, `kvhtml.h`, and `kvxtract.h`. These header files are in the `include` directory. The first entry in an enumerated type structure should be set to zero (0). Each subsequent entry is increased by 1. For example, the first five entries of `KVCharSet` in `kvtypes.h` are:

`KVCS_UNKNOWN`

`KVCS_SJIS`

`KVCS_GB`

`KVCS_BIG5`

`KVCS_KSC`

They would be set in the following way:

Enumerated Type	Setting
<code>KVCS_UNKNOWN</code>	0
<code>KVCS_SJIS</code>	1
<code>KVCS_GB</code>	2

Enumerated Type	Setting
-----------------	---------

KVCS_BIG5	3
-----------	---

KVCS_KSC	4
----------	---

You can also set many enumerated types by entering the appropriate symbolic constant, or TRUE or FALSE.

Programming Guidelines

When KeyView is enhanced in future releases, some enumerated types might be expanded. For example, new format IDs might be added to the `ENdocFmt` enumerated type, or new error codes might be added to the `KVErrorCodeEx` enumerated type. When you use these expandable types, your code should ensure binary compatibility with future releases.

For example, if you use an array to access error messages based on an error code, your code should check that the error code is less than `KVError_Last` before accessing the data. This ensures that new error codes are detected when you add KeyView binary files from new releases to your existing installation.

The following enumerated types are expandable:

`KVErrorCodeEx`

`KVMetadataType`

`KVCharSet`

`KVLanguageID`

`KVSubfileType`

`ENdocFmt`

ENSATableBorder

This enumerated type defines the type of border to display around tables. This enumerated type is defined in `kvtypes.h`.

Definition

```
typedef enum tag_ENSTableBorder
{
    SA_BaseOnDocument,
    SA_NoBorder,
    SA_Border
}
ENSTableBorder;
```

Enumerators

SA_BaseOnDocument	Border type is based on the document.
SA_NoBorder	Table borders are always off.
SA_Border	Table borders are always on.

KVCredKeyType

This enumerated type defines the type of credential used to open a protected file. See [KVCredentialComponent](#), on page 140. This enumerated type is defined in `kvextract.h`.

Definition

```
typedef enum tag_KVCredKeyType
{
    KVCredKeyType_UserName,
    KVCredKeyType_UserIdFile,
    KVCredKeyType_Password,
}
KVCredKeyType;
```

Enumerators

KVCredKeyType_UserName	The credential in KVCredentialComponent is a user name.
KVCredKeyType_UserIdFile	The credential in KVCredentialComponent is a path to a file that contains user IDs.
KVCredKeyType_Password	The credential in KVCredentialComponent is a password.

KVErrorCode

This enumerated type defines the type of error generated if Export fails. This enumerated type is defined in `kvtypes.h`.

Definition

```
typedef enum tag_KVErrorCode
{
    KVERR_Success,          /* 0 Success*/
}
```

```
KVERR_DLLNotFound,          /* 1  DLL or shared library not found*/
KVERR_OutOfCore,           /* 2  memory allocation failure*/
KVERR_processCancelled,    /* 3  fpContinue() returns FALSE*/
KVERR_badInputStream,      /* 4  Invalid/corrupt input stream*/
KVERR_badOutputType,       /* 5  Invalid output type requested*/
KVERR_General,             /* 6  General error....  */
KVERR_FormatNotSupported,  /* 7  Format not supported*/
KVERR_PasswordProtected,   /* 8  File is Password Protected*/
KVERR_ADSNotFound,         /* 9  Adobe Document Server not found*/
KVERR_AutoDetFail,         /* 10 Autodetect error*/
KVERR_AutoDetNoFormat,     /* 11 Unable to detect file format*/
KVERR_ReaderInitError,     /* 12 Error initializing the reader*/
KVERR_NoReader,            /* 13 No reader available for this format*/
KVERR_CreateOutputFileFailed, /* 14 Unable to create output file*/
KVERR_CreateTempFileFailed, /* 15 Unable to create temp file*/
KVERR_ErrorWritingToOutputFile, /* 16 Error writing to output file*/
KVERR_CreateProcessFailed, /* 17 Error creating a child process*/
KVERR_WaitForChildFailed,  /* 18 Wait for child process failed*/
KVERR_ChildTimeOut,        /* 19 Child process hung / timed out*/
KVERR_ArchiveFileNotFound, /* 20 Attempt to extract nonexistent file*/
KVERR_ArchiveFatalError    /* 21 Fatal error processing archive - should abort*/
}
KVerErrorcode;
```

Enumerators

KVERR_SUCCESS	The function completed successfully.
KVERR_DLLNotFound	A DLL or shared library was not found.
KVERR_OutOfCore	Memory allocation failure.
KVERR_processCancelled	The callback function <code>fpContinue()</code> returns <code>FALSE</code> .
KVERR_badInputStream	Invalid or corrupt input stream.
KVERR_badOutputType	Invalid output is requested.
KVERR_General	General error.
KVERR_FormatNotSupported	The file format is not supported.
KVERR_PasswordProtected	The file is encrypted or password-protected. KeyView supports only secure PST files.
KVERR_ADSNotFound	Adobe Document Server not found. This error is obsolete.
KVERR_AutoDetFail	Autodetect error.
KVERR_AutoDetNoFormat	Unable to detect file format.

KVERR_ReaderInitError	Error initializing the reader.
KVERR_NoReader	No reader is available for this format.
KVERR_CreateOutputFileFailed	Unable to create output file. This error is generated if the overwrite flag in KVExtractSubFileArg is FALSE, and a subfile has the same name as a file in the target path.
KVERR_CreateTempFileFailed	Unable to create temporary file.
KVERR_ErrorWritingToOutputFile	There was an error writing to the output file.
KVERR_CreateProcessFailed	There was an error creating a child process.
KVERR_WaitForChildFailed	The wait for child process failed.
KVERR_ChildTimeOut	The child process hung or timed out.
KVERR_ArchiveFileNotFound	Attempt to extract nonexistent file.
KVERR_ArchiveFatalError	A fatal error occurred processing an archive file.

KVErrorCodeEx

This enumerated type defines extended error codes. The type is defined in `kvtypes.h`.

Definition

```
typedef enum tag_KVErrorCodeEx
{
    KVErrror_OpenStreamFailure = KVERR_ArchiveFatalError + 1, /* 22 KVOpen stream
failure */
    KVErrror_InterfaceFunctionNotFound, /* 23 Interface function not found */
    KVErrror_InputFileNotFound, /* 24 Cannot find input file*/
    KVErrror_OpenOutputFileFailed, /* 25 Cannot open output file*/
    KVErrror_MemoryLeak, /* 26 Memory leak*/
    KVErrror_MemoryOverwrite, /* 27 Memory overwrite*/
    KVErrror_GPF, /* 28 Exception during oop filtering*/
    KVErrror_OopCore, /* 29 Core dump in child process*/
    KVErrror_KVoopLogFailed, /* 30 Creation of oop error log failed*/
    KVErrror_OverNestedFileLimit, /* 31 File exceeds nested file limit*/
    KVErrror_PSTAccessFailed, /* 32 Access failed on PST files*/
    KVErrror_PasswordRequired, /* 33 Password required to access file*/
    KVErrror_InvalidArgs /* 34 Input argument/structure is invalid*/
    KVErrror_ReaderUsageDenied, /* 35 Reader requires a valid license*/
    KVErrror_OopBadConfig, /* 36 Config buffer data was incomplete*/
}
```

```
KVError_OopBrokenPipe,      /* 37 Read/write to/from pipe failed*/
KVError_OopPipeOEF,        /* 38 Pipe was closed prior to read/write*/
KVError_IPCTimeOut,        /* 39 Pipe/socket timed out on poll/select*/
KVError_InvalidOopDriverSignature, /* 40 Client sent request to OOP server but
context driver does not exist on the server*/
KVError_InvalidOopServiceSignature, /* 41 Client sent request to OOP service that
does not exist*/
KVError_ZeroFile,          /* 42 Input file is empty or zero bytes */
KVError_CompressionNotSupported /* 43 File or subfile is compressed with
unsupported method */KVError_NoTemplates /* 44 No templates found (nsfsr) */
KVError_NoMainTemplate /* 45 No main template found (nsfsr) */
KVError_InvalidTemplate /* 46 Invalid template (nsfsr) */
KVError_TemplateError /* 47 Template error (nsfsr) */
KVError_IsADirectory /* 48 A directory exists at the given pathname */
KVError_Last /* 49 */
}
KVErrCodeEx;
```

Enumerators

KVError_OpenStreamFailure = KVERR_ArchiveFatalError +1	Failed to open a stream during out-of-process filtering. This is an extended error for the KVERR_General code. This enumerator is used by KeyView Filter.
KVError_ InterfaceFunctionNotFound	An interface function was not found during out-of-process filtering. This is an extended error for the KVERR_General code. This enumerator is used by KeyView Filter.
KVError_InputFileNotFound	Could not find the input file during out-of-process filtering. This is an extended error for the KVERR_General code. This enumerator is used by KeyView Filter.
KVError_ OpenOutputFileFailed	Could not open the output file during out-of-process filtering. This is an extended error for the KVERR_General code. This enumerator is used by KeyView Filter.
KVError_MemoryLeak	A memory leak occurred during out-of-process filtering. This is an extended error for the KVERR_General code. This enumerator is used by KeyView Filter.
KVError_MemoryOverwrite	A memory overwrite occurred during out-of-process filtering. This is an extended error for the KVERR_General code. This enumerator is used by KeyView Filter.
KVError_GPF	An exception occurred during out-of-process filtering. This is an extended error for the KVERR_General code. This enumerator is used by KeyView Filter.
KVError_OopCore	A memory dump was generated in a child process during out-of-process filtering. This is an extended error for the KVERR_General

	code. This enumerator is used by KeyView Filter.
KVError_KVoopLogFailed	The creation of the out-of-process error log failed. This is an extended error for the KVERR_General code. This enumerator is used by KeyView Filter.
KVError_OverNestedFileLimit	The container file has more than the allowable number of child documents. One or more child documents were not converted. Currently, this enumerator is not used.
KVError_PSTAccessFailed	<p>The PST file could not be converted. This error might be returned when a call to <code>fpOpenFile()</code> returns <code>NULL</code> for one of the following reasons:</p> <ul style="list-style-type: none"> • A Microsoft Outlook client is not installed. • A Microsoft Outlook client is installed, but is not the default email client. • A Microsoft Outlook client is installed, but is not configured correctly. • The PST file is corrupt. • The PST file is read-only (PST files must allow read and write access). • The MAPI call fails. • The bit editions of Microsoft Outlook do not match the bit editions of the KeyView software. <p>For example, if 32-bit KeyView is used, 32-bit Outlook must be installed. If 64-bit KeyView is used, 64-bit Outlook must be installed.</p>
KVError_PasswordRequired	To open the file, you must provide credentials. This error might be returned when a call to <code>fpOpenFile()</code> returns <code>NULL</code> .
KVError_InvalidArgs	The input argument or structure is invalid. This error is generated by the File Extraction APIs.
KVError_ReaderUsageDenied	<p>The current license key does not enable the document reader required to convert the file. This error might be returned when a call to <code>fpOpenFile()</code> returns <code>NULL</code>.</p> <p>Some document readers are considered advanced features and are licensed separately from the KeyView SDK (for example, the PST and MBX readers). Contact your Micro Focus sales representative to get an updated license key.</p>
KVError_OopBadConfig	Information in the <code>kvxconfig.ini</code> file is incomplete and cannot be used to the XML file. This is used by KeyView Filter.
KVError_OopBrokenPipe	Data was not transferred between the parent and child processes during out-of-process filtering because either the parent or child failed. This is used by KeyView Filter.

KVError_OopPipeOEF	Data was not transferred between the parent and child processes during out-of-process filtering because the parent process was shut down. This is used by KeyView Filter.
KVError_IPCTimeOut	Either the parent or child process is waiting for a reply or request during out-of-process filtering. This is used by KeyView Filter.
KVError_InvalidOopDriverSignature	A client sent a request to an out-of-process server, but the context driver does not exist on the server. This is used by KeyView Filter.
KVError_InvalidOopServiceSignature	A client sent a request to a File Extraction service that does not exist. If this error is generated on the call to <code>fpClose()</code> , you can ignore it. This is used by KeyView Filter.
KVError_ZeroFile	The input file is empty or zero bytes.
KVError_CompressionNotSupported	The file or subfile is compressed with an unsupported compression method.
KVError_NoTemplates	
KVError_NoMainTemplate	
KVError_InvalidTemplate	
KVError_TemplateError	
KVError_IsADirectory	
KVError_Last	

Discussion

- When error reporting is enhanced in future releases, new error messages might be added to this enumerator type. When you use this type, your code must ensure binary compatibility with future releases. See [Programming Guidelines, on page 227](#).
- If an extended error code is called for a format to which the error does not apply, the `KVError_Last` code is returned.

KVHTMLStyleSheetType

This enumerated type defines the options for processing style sheet information. This enumerated type is defined in `kvhtml.h`.

Definition

```
typedef enum tag_KVHTMLStyleSheetType{    STYLESHEET_DISABLED = 0,  
    CSS_INLINE,
```

```
        CSS_TOFILE  
    }  
    KVHTMLStyleSheetType;
```

Enumerators

STYLESHEET_DISABLED	Disables Cascading Style Sheet (CSS) formatting.
CSS_INLINE	Enables CSS formatting and adds style sheet information inline to the HTML output file.
CSS_TOFILE	<p>Enables CSS formatting, and generates an external file or uses an existing external file, which is referenced in a <code><link...></code> element. If <code>CSS_TOFILE</code> is set, you must use the <code>\$STYLESHEET</code> token to specify the URL of the style sheet in the HTML output.</p> <p>The <code>-c</code> option can be used in the <code>htmlini</code> sample program to specify the full path and file name of an external CSS file.</p> <p>Applies to word processing documents only.</p>

KVHTMLAnchorTypeEx

This enumerated type defines the anchor types for the output stream. This enumerated type is defined in `kvhtml.h`.

Definition

```
typedef enum tag_KVHTMLAnchorTypeEx  
{  
    VectorPictureAnchorEx = 0,  
    RasterPictureAnchorEx,  
    H1AnchorEx,  
    H2AnchorEx,  
    H3AnchorEx,  
    H4AnchorEx,  
    H5AnchorEx,  
    H6AnchorEx,  
    XAnchorEx,  
    AnimatedGIFAnchorEx,
```

```
CSSAnchorEx,  
GeneralAnchorEx,  
DBAnchorEx,  
JPEGAnchorEx  
}  
KVHTMLAnchorTypeEx;
```

Enumerators

VectorPictureAnchor	An anchor for embedded vector graphics.
RasterPictureAnchor	An anchor for embedded raster graphics.
H1Anchor	An anchor for level 1 heading blocks (H1).
H2Anchor	An anchor for level 2 heading blocks (H2).
H3Anchor	An anchor for level 3 heading blocks (H3).
H4Anchor	An anchor for level 4 heading blocks (H4).
H5Anchor	An anchor for level 5 heading blocks (H5).
H6Anchor	An anchor for level 6 heading blocks (H6).
XAnchor	An anchor for an external file.
AnimatedGIFAnchor	An anchor for embedded animated GIF graphics.
CSSAnchor	An anchor for an external CSS file.
GeneralAnchor	Reserved for future use.
DBAnchor	Used internally.
JPEGAnchor	An anchor for an embedded JPEG graphic.

KVHTMLGraphicType

This enumerated type defines graphic formats to which embedded graphics and presentations are converted. This enumerated type is defined in `kvhtml.h`.

Definition

```
typedef enum tag_KVHTMLGraphicType  
{  
    KVGFX_GIF,
```

```
KVGFX_JPEG,  
KVGFX_PNG,  
KVGFX_CGM,  
KVGFX_WMF,  
KVGFX_HTML  
KVGFX_JAVA  
}  
KVHTMLGraphicType;
```

Enumerators

KVGFX_GIF	Specifies GIF (Graphics Interchange Format) as the graphic type.
KVGFX_JPEG	Specifies JPEG (Joint Photographic Experts Group) as the graphic type.
KVGFX_PNG	Specifies PNG (Portable Network Graphics) as the graphic type.
KVGFX_CGM	Deprecated.
KVGFX_WMF	Specifies WMF (Windows Metafile) as the graphic type.
KVGFX_JAVA	Deprecated.
KVGFX_HTML	Specifies that text in presentations are converted to HTML.

KVHeadingCreateOptions

This enumerated type defines whether Export generates blocks and block chunks based only on the heading styles defined in a source document (if they are available), or based on both the source document's heading styles and headings that are created automatically by Export. Headings that are created automatically by Export are based on the text attributes of the source document as defined by KVHTMLHeadingInfo). This enumerated type is defined in kvhtml.h.

Definition

```
typedef enum tag_KVHeadingCreateOptions  
{  
    KVHC_DocHeadingsOnly,  
    KVHC_CreateHeadingsAlways  
}  
KVHeadingCreateOptions;
```

Enumerators

KVHC_DocHeadingsOnly	This instructs Export to rely exclusively on heading styles defined in the source document. However, if the source document does not contain heading styles, Export generates blocks on its own using the criteria defined by the structure <code>KVHeadingInfo</code> .
KVHC_CreateHeadingsAlways	This instructs Export to use the heading styles in the source document when available, and to also automatically create table of contents entries based on the criteria defined by the structure <code>KVHeadingInfo</code> .

KVMetadataType

This enumerated type defines the data type of metadata that can be extracted from a subfile in a mail message or mail store. If a metadata field has a corresponding KeyView type in `KVMetadataType`, the metadata is converted to the [KVMetadataElem](#) structure, and the structure member `isValid` is 1. This enumerated type is defined in `kvtypes.h`.

Definition

```
typedef enum
{
    KVMetadata_Unknown      = 0,
    KVMetadata_Bool         = 1,
    KVMetadata_Binary       = 2,
    KVMetadata_Int4         = 3,
    KVMetadata_UInt4        = 4,
    KVMetadata_Int8         = 5,
    KVMetadata_UInt8        = 6,
    KVMetadata_String       = 7,
    KVMetadata_Unicode      = 8,
    KVMetadata_DateTime     = 9,
    KVMetadata_Float        = 10,
    KVMetadata_Double       = 11,
    KVMetadata_Last
}
KVMetadataType;
```

Enumerators

KVMetadata_Unknown	The value in the property is of an unknown type.
KVMetadata_Bool	The value in the property is a Boolean value. The corresponding MAPI type is <code>PT_BOOLEAN</code> .

KVMetadata_ Binary	The value in the property is a byte array. The corresponding MAPI type is PT_BINARY.
KVMetadata_ Int4	The value in the property is a signed 4-byte integer. The corresponding MAPI types are PT_I2, PT_SHORT, PT_I4, and PT_LONG.
KVMetadata_ UInt4	The value in the property is an unsigned 4-byte integer. This type is not currently supported.
KVMetadata_ Int8	The value in the property is a signed 8-byte integer. This type is not currently supported.
KVMetadata_ UInt8	The value in the property is an unsigned 8-byte integer. This type is not currently supported.
KVMetadata_ String	The value in the property is a string. The corresponding MAPI type is PT_STRING8.
KVMetadata_ Unicode	The value in the property is a Unicode string. The corresponding MAPI type is PT_UNICODE.
KVMetadata_ DateTime	The value in the property is a date and time. The corresponding MAPI type is PT_SYSTIME.
KVMetadata_ Float	The value in the property is a 4-byte float. The corresponding MAPI type is PT_FLOAT.
KVMetadata_ Double	The value in the property is an 8-byte double. The corresponding MAPI type is PT_DOUBLE.

Discussion

New types might be added to this enumerated type. When you use this type, your code should ensure binary compatibility with future releases. See [Programming Guidelines, on page 227](#).

KVMetaNameType

This enumerated type defines the type of metadata fields extracted from a subfile in a mail message or mail store. See [KVMetaName, on page 146](#). This enumerated type is defined in `kvextract.h`.

Definition

```
typedef enum
{
    KVMetaNameType_Integer = 0,
    KVMetaNameType_String  = 1
}
KVMetaNameType;
```

Enumerators

`KVMetaNameType_Integer` The metadata field is an integer.

`KVMetaNameType_String` The metadata field is a string.

KVSumInfoType

This enumerated type defines the data type of the metadata field extracted from a document. This enumerated type is defined in `kvtypes.h`.

Definition

```
typedef enum tag_KVSumInfoType
{
    KV_String          = 0x1,
    KV_Int4            = 0x2,
    KV_DateTime        = 0x3,
    KV_ClipBoard       = 0x4,
    KV_Bool            = 0x5,
    KV_Unicode         = 0x6,
    KV_IEEE8           = 0x7,
    KV_Other           = 0x8
}
KVSumInfoType;
```

Enumerators

`KV_String` The value in the metadata field is a string.

`KV_Int4` The value in the metadata field is an integer.

`KV_DateTime` The value in the metadata field is a date and time. This type is a 64-bit value representing the number of 100-nanosecond intervals since January 1, 1601 (Windows FILETIME EPOCH). You might need to convert this value into another format.

`KV_ClipBoard` Currently not supported.

`KV_Bool` The value in the metadata field is a Boolean value.

`KV_Unicode` The value in the metadata field is a Unicode string.

`KV_IEEE8` The value in the metadata field is an IEEE 8-byte integer.

`KV_Other` The value in the metadata field is user-defined.

KVSumType

This enumerated type defines the metadata fields that can be extracted from a document. This enumerated type is defined in `kvtypes.h`.

- Types 0 to 34 and type 42 are Office summary fields.
- Types 35 to 40 are computer-aided design (CAD) metadata fields.
- Type 41, `KV_OrigAppVersion`, is shared by Office software and CAD.

Types 43 or greater are reserved for any non-standard metadata field defined in a document.

Definition

```
typedef enum tag_KVSumType
```

```
    KV_CodePage           = 0,  
    KV_Title              = 1,  
    KV_Subject             = 2,  
    KV_Author              = 3,  
    KV_Keywords            = 4,  
    KV_Comments            = 5,  
    KV_Template            = 6,  
    KV_LastAuthor          = 7,  
    KV_RevNumber           = 8,  
    KV_EditTime            = 9,  
    KV_LastPrinted         = 10,  
    KV_Create_DTM          = 11,  
    KV_LastSave_DTM        = 12,  
    KV_PageCount           = 13,  
    KV_WordCount           = 14,  
    KV_CharCount           = 15,  
    KV_ThumbNail           = 16,  
    KV_AppName             = 17,  
    KV_Security             = 18,  
    KV_Category            = 19,  
    KV_PresentationTarget  = 20,  
    KV_Bytes               = 21,  
    KV_Lines               = 22,  
    KV_Paragraphs          = 23,  
    KV_Slides              = 24,  
    KV_Notes               = 25,  
    KV_HiddenSlides        = 26,  
    KV_MMClips             = 27,  
    KV_ScaleCrop           = 28,  
    KV_HeadingPairs        = 29,  
    KV_TitlesofParts       = 30,  
    KV_Manager             = 31,
```

```
KV_Company          = 32,  
KV_LinksUpToDate    = 33,  
KV_HyperlinkBase    = 34,  
KV_Layouts          = 35,  
KV_Objects          = 36,  
KV_FileVersion      = 37,  
KV_LastFileVersion  = 38,  
KV_OrigFileVersion  = 39,  
KV_OrigFileType     = 40,  
KV_OrigAppVersion   = 41,  
KV_ContentStatus    = 42,  
KV_UserDefined      = 43  
}  
KVSumType;
```

Enumerators

KV_CodePage	The code page of the document.
KV_Title	The contents of the "Title" property field taken from the source document.
KV_Subject	The contents of the "Subject" property field taken from the source document.
KV_Author	The contents of the "Author" property field taken from the source document.
KV_Keywords	The contents of the "Keywords" property field taken from the source document.
KV_Comments	The contents of the "Comments" property field taken from the source document.
KV_Template	The contents of the "Template" property field taken from the source document.
KV_LastSavedby	The contents of the "Last saved by" property field taken from the source document.
KV_RevNumber	The contents of the "Revision number" property field taken from the source document.
KV_EditTime	The contents of the "Total editing time" property field taken from the source document.
KV_LastPrinted	The contents of the "Printed" property field taken from the source document.
KV_Create_DTM	The contents of the "Created" property field taken from the source document.
KV_LastSave_DTM	The contents of the "Modified" property field taken from the source document.
KV_PageCount	The contents of the "Pages" property field taken from the source document.

	The field provides the number of pages in the document.
KV_WordCount	The contents of the "Words" property field taken from the source document. The field provides the number of words in the document.
KV_CharCount	The contents of the "Characters" property field taken from the source document. The field provides the number of characters in the document.
KV_ThumbNail	A thumbnail image of a document.
KV_AppName	The contents of the "Type" property field taken from the source document. This field identifies the application used to read the document.
KV_Security	The contents of the "Attributes" property field taken from the source document.
KV_Category	The contents of the "Category" property field taken from the source document.
KV_PresentationTarget	The target format for presentations (35mm, printer, video, and so on).
KV_Bytes	The contents of the "Size" property field taken from the source document. The field provides the size of the file in bytes.
KV_Lines	The contents of the "Lines" property field taken from the source document. The field provides the number of lines in the document.
KV_Paragraphs	The contents of the "Paragraphs" property field taken from the source document. The field provides the number of paragraphs in the document.
KV_Slides	The contents of the "Slides" property field taken from a presentation document. The field provides the number of slides in the document.
KV_Notes	The contents of the "Notes" property field taken from a presentation document. The field provides the number of notes in the document.
KV_HiddenSlides	The contents of the "Hidden slides" property field taken from a presentation document. The field provides the number of hidden slides in the document.
KV_MMClips	The contents of the "Multimedia clips" property field taken from a presentation document. The field provides the number of multimedia clips in the document.
KV_ScaleCrop	A Boolean value that specifies whether thumbnails are cropped or scaled.
KV_HeadingPairs	An internally-used property indicating the grouping of different document parts and the number of items in each group.
KV_TitlesofParts	The contents of the "Document Contents" property field taken from the source document. The field contains a list of the parts of the file, such as the names of macro sheets in Microsoft Excel or the headings in Word.
KV_Manager	The contents of the "Manager" property field taken from the source document.

KV_Company	The contents of the "Company" property field taken from the source document.
KV_LinksUpToDate	A Boolean value that specifies whether links in the document are resolved and current.
KV_HyperlinkBase	The base address used for all relative links in the file.
KV_Layouts	The number of layouts in the AutoCAD drawing.
KV_Objects	The approximate number of objects in the AutoCAD drawing.
KV_FileVersion	The AutoCAD version (for example, R13, R14) of the drawing.
KV_LastFileVersion	The AutoCAD version (for example, R13, R14) that the AutoCAD drawing was last saved as.
KV_OrigFileVersion	The AutoCAD version (for example, R13, R14) of the original source file.
KV_OrigFileType	The AutoCAD file type (for example, DWG, DXF, or DWB) of the original source file.
KV_OrigAppVersion	The AutoCAD version (for example, R13, R14) of the application that created the original source file.
KV_ContentStatus	The status of the content, for example Draft, Reviewed, or Final.
KV_UserDefined	The contents of the first entry in the array of non-standard metadata. This could be user-defined metadata, or metadata unique to a file type.

LPDF_DIRECTION

This enumerated type defines the paragraph direction of extracted paragraphs from a PDF file when logical order is enabled. This enumerated type is defined in `kvtypes.h`.

Definition

```
typedef enum{
    LPDF_RAW = 0,
    LPDF_LTR,
    LPDF_RTL,
    LPDF_AUTO
} LPDF_DIRECTION ;
```

Enumerators

LPDF_ RAW Unstructured paragraph flow. This is the default behavior.

LPDF_ LTR Logical reading order and left-to-right paragraph direction.

LPDF_ Logical reading order and right-to-left paragraph direction.
RTL

LPDF_ Logical reading order. The PDF reader determines the paragraph direction for each PDF
AUTO page, and then sets the direction accordingly. This is the default when logical order is
enabled.

RM_Title_Flag

This enumerated type defines the information that appears in the `title` attribute in the `<ins>` and `` tags for the `eFlag` member of the `KV_RM_Title` structure. This applies when revision information is enabled and included in the HTML output.

Definition

```
typedef enum  
{  
    RMT_Off = 0,  
    RMT_Author,  
    RMT_Datetime,  
    RMT_AuthorDatetime  
}
```

RM_Title_Flag;

Enumerators

RMT_Off A `title` attribute is not included in the `<ins>` and `` tags. This would generate markup similar to the following:

```
<ins cite="mailto:JohnD"  
datetime="2006-04-24T14:47:00">This  
text was added</ins>
```

RMT_Author The reviewer's name is generated in the `title` attribute of the `<ins>` and `` tags. This would generate markup similar to the following:

```
<ins title="Inserted: JohnD"  
cite="mailto:JohnD" datetime="2006-  
04-24T14:47:00">This text was  
added</ins>
```

RMT_Datetime The date and time is included in the `title` attribute of the `<ins>` and `` tags. The date is in ISO-8601 format: `YYYY-MM-DDThh:mm:ss`. This would generate markup

similar to the following:

```
<ins title="Inserted: 2006-04-24T14:47:00" cite="mailto:JohnD"
datetime="2006-04-24T14:47:00">This
text was added</ins>
```

RMT_AuthorDatetime

The reviewer's name, date, and time are included in the `title` attribute of the `<ins>` and `` tags. This would generate markup similar to the following:

```
<ins title="Inserted: JohnD, 2006-04-24T14:47:00" cite="mailto:JohnD"
datetime="2006-04-24T14:47:00">This
text was added</ins>
```

This is the default.

Part IV: COM API Reference

This section provides detailed reference information for the COM implementation of the HTML Export API.

- [COM Interface Methods and Events](#)
- [COM Interface Properties](#)

Chapter 12: COM Interface Methods and Events

This section describes the methods that HTML Export uses to manage the input and output streams, and to perform the actual document conversion. It also describes the events that allow the calling application to monitor and affect the HTML conversion while it is in progress.

The methods' syntax are described as they would be used from within Visual Basic, where HTM is the COM Automation Server object. The events are described with the Interface Description Language (IDL). See the Template Wizard or `comsamp` sample programs for examples of how to use the events from Visual Basic.

Methods

- [AddStyleMapping](#), below
- [ConvertFileToFile](#), on the next page
- [GetFileInfo](#), on the next page
- [GetStyleMapping](#), on the next page
- [GetSummaryInfo](#), on page 249
- [RemoveStyleMapping](#), on page 250
- [Unload](#), on page 250
- [UpdateFromIniFile](#), on page 250
- [HTMLConfig](#), on page 250

Events

- [Continue](#), on page 251
- [UserCallback](#), on page 251

AddStyleMapping

This method maps a character or paragraph style to arbitrary markup. See [Map Styles](#), on page 81 for more information on style mapping.

```
HTM.AddStyleMapping(StyleName, MarkupStart, MarkupEnd, nFlags)
```

where:

- `StyleName` is the name of the word processing style (for example, "Heading 1") to which style mapping is applied. Style names are case sensitive.
- `MarkupStart` is the markup to be added at the beginning of the content (for example, `<h1>`).
- `MarkupEnd` is the markup to be added at the end of the content (for example, `<\h1>`).

- `nFlags` is the flag set for this markup. A flag specifies how the content associated with the style should be processed. Possible values are enumerated in `kvtypes.h`. See [Flags for Defining Styles, on page 83](#) for a description of the flags.

NOTE: By default, HTML Export maps the heading style "Heading 1" to `<h1></h1>`, and so on, for heading levels 1 through 6. If you use style mappings, the default mapping is overridden. Therefore, you must supply markup for *all* heading levels. HTML Export uses heading levels to define the overall structure of the HTML output.

ConvertFileToFile

This method converts a specified file to HTML.

```
nRet = HTM.ConvertFileToFile(szTargetFile)
```

where:

- `szTargetFile` is the complete path and file name of the HTML output.
- `nRet` is the return error code as defined in the `KVErrorCode` enumerated type defined in `kvtypes.h`.

GetFileInfo

This method retrieves information about the source file (as defined in the `pszInputFile` property).

```
HTM.GetFileInfo(lcharSet, ldocClass, ldocFmt, ldocVersion,  
ldocAttributes)
```

where:

- `lcharSet` is the same as the `InputCharSet` property
- `docClass` is the same as the `adInfo_docClass` property
- `ldocFmt` is the same as the `adInfo_docFmt` property
- `ldocVersion` is the same as the `adInfo_docVersion` property
- `ldocAttributes` is the same as the `bAllowHeadingsInTables` property

See [COM Interface Properties, on page 252](#) for a description of these properties.

NOTE: This method fills in all of these parameters (long) based on the source document.

GetStyleMapping

This method gets the formatting specifically assigned to various styles.

```
HTM.GetStyleMapping(nItem, StyleName, MarkupStart, MarkupEnd,  
nFlags)
```

See [AddStyleMapping, on the previous page](#) for a description of `StyleName`, `MarkupStart`, `MarkupEnd`, and `nFlags`.

By specifying `nItem` (which can be any value from 0 to `NumStyles - 1` where `pszBaseURL` is a property), the `StyleName`, `MarkupStart`, `MarkupEnd`, and `nFlags` parameters are filled in.

GetSummaryInfo

This method retrieves metadata from the input file.

```
HTM.GetSummaryInfo(nItem, lTotalItems, lValid, lType, lVal, szVal, szValUser)
```

where:

- `nItem` is an integer which is the metadata item number. See `KVSumType` in `kvtypes.h` for a list of values.
For example, `KV_Author` is value 3, so setting `nItem` to 3 would retrieve the Author of the source document if this information was available. This is identical to using the `pszAuthor` property (some common metadata items are exposed as properties as well as being accessible through this method).
- `lTotalItems` is a long which is returned to give the total number of metadata items possible. This is 34 for most documents (as defined in `KVSumType` in `kvtypes.h`), although all 34 might not be valid (see `lValid` parameter). If there is user-defined metadata available, `lTotalItems` might be greater than 34.
- `lValid` is a long which is 0 if the item is invalid (not available) and 1 if the information associated with this item is available.
- `lType` is a long which corresponds to the `KVSumInfoType` enumerated type defined in `kvtypes.h`. A value of 1 indicates that `szVal` contains the string associated with this item (if `lValid` is also 1). A value of 2 indicates that `lVal` contains a long associated with this item (if `lValid` is also 1). See [KVSumType, on page 240](#).
- `szValUser` is a string description of the metadata item.

Sample Code

The following code from the `comsamp` sample program demonstrates how to use the `GetSummaryInfo` method:

```
Dim nTotal As Long
Dim nValid As Long
Dim nType As Long
Dim nVal As Long
Dim szVal As String
Dim szUserVal As String
On Error GoTo Handler
' Get the Author if available (item 3 is the Author. See KVSumType
' in kvtypes.h for a list of items and their values)
Call MyRef.GetSummaryInfo(3, nTotal, nValid, nType, nVal, szVal, szUserVal)
MsgBox szUserVal & " = " & szVal
```

RemoveStyleMapping

This method disables an instance of style mapping.

```
HTM.RemoveStyleMapping(nItem)
```

where:

- *nItem* is the style mapping item to remove (See [GetStyleMapping, on page 248](#)).

Unload

This method unloads the `htmserver` object.

```
HTM.Unload()
```

This method applies only to the out-of-process COM object and normally is not necessary. Note that using this method forces an unload, even if the object's reference count is not zero.

UpdateFromIniFile

This method updates parameters from the template file.

```
HTM.UpdateFromIniFile(szIniFile)
```

where:

- *szIniFile* is the complete path and file name of a supplied template file (see the directory `install\htmlexport\programs\ini` for examples of template files).

HTMLConfig

This method provides a way to configure options prior to document conversion. Currently, the function is used to specify a PDF reader. For more information, see [Convert PDF Files to Raster Images, on page 92](#).

```
HTM.HTMLConfig(nType, nValue, p)
```

where:

- *nType* is a symbolic constant defined in `kvhtml.h` and used to configure options. Currently, you can set this to `KVCFG_SETHIFIPDF`. This option specifies that the graphic-based PDF reader (`kppdfldr`) is used to convert PDF documents. See [Convert PDF Files to Raster Images, on page 92](#).
- *nValue* is an integer value defined for the above type.
- *p* is reserved, and must be `NULL`.

The `comsmp` sample program demonstrates how to use this method. See [comsmp, on page 127](#).

Continue

This event has two purposes: to enable the calling process to monitor the progress of the HTML conversion, and to provide a way of terminating a conversion before it is completed.

```
Continue([in] int PercentDone,  
         [out, retval] int *bQuit);
```

The sample program `compsamp` demonstrates how to use this event.

UserCallback

This event allows the calling process to insert optional data into selected points of the HTML output. This event is triggered by the inclusion of the `$USERCB=X` token in one of the properties, where `X` identifies the callback. The text in `szUserString` is inserted in the HTML. See [\\$USERCB](#), on page 361.

```
UserCallback([in] BSTR szUserString,  
             [out, retval] BSTR *pszVal);
```

The `compsamp` sample program demonstrates how to use this event.

Chapter 13: COM Interface Properties

This section contains an alphabetized list of all the properties in the COM Interface.

Some of the descriptions refer to enumerated types in `adinfo.h`, `kvhtml.h`, or `kvtypes.h`. These header files are located in the `include` directory. See [Enumerated Types, on page 226](#) for more information on enumerated types.

Some of the classes use HTML Export tokens. See [Export Tokens, on page 359](#) for a description of these tokens.

adInfo_docAttributes

This is a read-only property.

The attributes of the source document. The document attributes are enumerated in `ENdocAttributes` of `adinfo.h`:

- `kEncrypted`
- `kMacBinaryEncoded`
- `kAppleSingleENcoded`
- `kAppleDoubleEncoded`
- `kWangGDIencoded`

adInfo_docClass

This is a read-only property.

The class of the source document. The format classes are enumerated in `ENdocClass` of `adinfo.h`.

A value of `-1` indicates that HTML Export encountered an error while attempting to detect the class of the source document. Zero (`0`) indicates that HTML Export is unable to determine the format of the source document.

adInfo_docFmt

This is a read-only property.

The format of the source document. This information determines which document reader is used to generate stream information during the conversion. The formats are enumerated in `ENdocFmt` of `adinfo.h`.

adInfo_docVersion

This is a read-only property.

The version of the source document's format.

This property is a long integer corresponding to the version number of the format `version# * 1000`. For example, version number 1.02 would be 1020.

bAllowHeadingsInTables

This is a read and write property.

This property determines whether or not the contents of tables are considered for automatic heading generation. If you set `bAllowHeadingsInTables` to `TRUE`, HTML Export considers converting the contents of tables to headings in the HTML output.

See [headingCreateType, on page 260](#) for more information on automatic generation of headings.

This property applies to word processing documents and spreadsheets only.

bDisplayRelativeFontSize

This is a read and write property.

Set `bDisplayRelativeFontSize` to `TRUE` to use relative font size tags in the HTML output. For example, the tag `` adds one to the base font size, which is normally three.

bEnableEmptyRows

This is a read and write property.

Set `bEnableEmptyRows` to `TRUE` to display empty rows in a spreadsheet format. If you set `bEnableEmptyRows` to `FALSE`, empty rows are not displayed. This property applies only to 20 or more consecutive empty rows. The default is `FALSE`.

This property applies to spreadsheets only.

bForceOutputCharSet

This is a read and write property.

Set `bForceOutputCharSet` to `TRUE` to use the output character set specified in `OutputCharSet`, regardless of the internal document information or the source character set specified by `SrcCharSet`.

See [Convert Character Sets, on page 76](#) for more information on character set mapping.

NOTE: Forcing a character set to `KVCS_UNKNOWN` is always ignored.

bForceSrcCharSet

This is a read and write property.

Set `bForceSrcCharSet` to `TRUE` to use the source character set specified in `SrcCharSet`, regardless of the internal document information.

See [Convert Character Sets, on page 76](#) for more information on character set mapping.

NOTE: Forcing a character set to `KVCS_UNKNOWN` is always ignored.

bGenerateURLs

This is a read and write property.

Set `bGenerateURLs` to `TRUE` to add anchor tags (`<a ...>`) to text starting with "www", "http:", or "file:".

This property applies to word processing documents only.

bHardPageMakesNewBlock

This is a read and write property.

Set `bHardPageMakesNewBlock` to `TRUE` to have hard page breaks in the source document generate new HTML files during the conversion process. `pszchunktemplate` provides the appropriate table of contents entry for the new block. See [pszChunkTemplate, on page 267](#).

This property applies to word processing documents and spreadsheets only.

bNbspEmptyCells

This is a read and write property.

Set `bNbspEmptyCells` to `TRUE` to include a non-breaking space (`<td> </td>`) in the markup for empty table cells in the source document. If you set `bNbspEmptyCells` to `FALSE`, `<td></td>` is generated for empty table cells.

This property applies to word processing documents and spreadsheets only.

bNoPictures

This is a read and write property.

Set `bNoPictures` to `TRUE` to generate verbose markup only. Embedded graphics are not generated as separate files, and image tags are not included in the output.

If you set `bNoPictures` to `FALSE`, embedded graphics in a document are regenerated as separate files, stored in the output directory, and image tags are included in the output.

To output graphics for presentations, you must set `bNoPictures` to `FALSE`, and set [bRasterizeFiles](#) to `TRUE`.

bPutBlocksInSeparateFiles

This is a read and write property.

Set `bPutBlocksInSeparateFiles` to `TRUE` to create a separate HTML file for each heading level 1 block. Each new block uses the markup defined in `pszStartBlock` and `pszEndBlock`. See [pszStartBlock, on page 271](#) and [pszEndBlock, on page 268](#). If you set `bPutBlocksInSeparateFiles` to `FALSE`, each heading level 1 block is placed sequentially in the same file, after the initial markup is written.

bRasterizeFiles

This is a read and write property.

Set `bRasterizeFiles` to `TRUE` to rasterize slides from presentations into single images. For this setting to take effect, you must also set the [bNoPictures](#) property to `FALSE`. The format the images are converted to is determined by the [OutputRasterGraphicType](#) property.

Set `bRasterizeFiles` to `FALSE` to convert the text in slides to HTML. When you set this property to `FALSE`, images do not appear in the HTML output.

bRemoveEmptyColumns

This is a read and write property.

Set `bRemoveEmptyColumns` to `TRUE` to remove spreadsheet columns that do not contain data and to disable cell merge. The default is `FALSE`.

This property applies to spreadsheets only.

bRemoveFileNameSpaces

This is a read and write property.

Set `bRemoveFileNameSpaces` to `TRUE` to remove spaces from generated output file names.

bSupportCellSpan

This is a read and write property.

Set `bSupportCellSpan` to `TRUE` to include `colspan="n"` markup in the output. If text in the source document spans across empty columns, and `bSupportCellSpan` is enabled, the text is output across columns in the HTML. If this option is disabled, text that spans across columns is output in a single cell. This property applies to spreadsheets only. The default value is `FALSE`.

bSupportColumnHeadings

This is a read and write property.

Set `bSupportColumnHeadings` to `TRUE` to include column headings from the source spreadsheet in the HTML output. This property applies to spreadsheets only. The default is `FALSE`.

bSupportColumnWidth

This is a read and write property.

Set `bSupportColumnWidth` to `TRUE` to include column width data from the source spreadsheet in the HTML output. This property applies to spreadsheets only. The default value is `FALSE`.

bSupportFontFace

This is a read and write property.

Set `bSupportFontFace` to `TRUE` to retain the font face information contained in the source document. If you set `bSupportFontFace` to `FALSE`, no `FACE` attributes appear in the `` tags of the HTML output.

bSupportRFC1942_cols

This is a read and write property.

Set `bSupportRFC1942_cols` to `TRUE` to include `cols=x` specifications in the `<table>` tags of the HTML output markup.

bSupportRowHeadings

This is a read and write property.

Set `bSupportRowHeadings` to `TRUE` to include row headings from the source spreadsheet in the HTML output. This property applies to spreadsheets only. The default is `FALSE`.

bSupportRowSpan

This is a read and write property.

Set `bSupportRowSpan` to `TRUE` to include row span data from the source spreadsheet in the HTML output. This property applies to spreadsheets only. The default value is `FALSE`.

bSupportUserFontSizeMapping

This is a read and write property.

Set `bSupportUserFontSizeMapping` to `TRUE` to use the font sizes specified in the `FontSizeMap` (see [FontSizeMap_nSize\[1...7\]](#), on page 260). If you set `bSupportUserFontSizeMapping` to `FALSE`, HTML Export uses default `SIZE` attributes.

bTableHTMLForSpreadsheetOnly

This is a read and write property.

Set `bTableHTMLForSpreadsheetOnly` to `TRUE` to control how spreadsheets are displayed in the HTML output. If you set `bTableHTMLForSpreadsheetOnly` to `FALSE`, cell color and border information from the source document is used. Use this parameter in conjunction with `pszTableHTML`.

bTabsToTables

This is a read and write property.

Set `bTabsToTables` to `TRUE` to convert tabbed columns to tables. This property applies to word processing documents only.

bUseDocumentColors

This is a read and write property.

Set `bUseDocumentColors` to `TRUE` to retain the color attributes information contained in the source document. If you set `bUseDocumentColors` to `FALSE`, no color attributes appear in the `` tags of the HTML output.

bUseDocumentFontInfo

This is a read and write property.

Set `bUseDocumentFontInfo` to `TRUE` to retain the font information contained in the source document. If you set `bUseDocumentFontInfo` to `FALSE`, no font information appears in the `` tags in the HTML output.

CodePage

This is a read-only property.

The character encoding of the document if available.

See [GetSummaryInfo](#), on page 249 for more information on all metadata that you can obtain from a document.

cRedact

This is a read and write property.

The character used to replace tagged text designated through style mapping to be omitted from the HTML output. This functionality is useful when you need to hide confidential or sensitive information. The default replacement character is "X".

The specified character is used for all text that is mapped to a style which is processed by using the `KVSTYLE_REDACT` flag (defined in `kvtypes.h`). See [Flags for Defining Styles, on page 83](#) for more information on style mapping and the `REDACT` flag.

This property applies to word processing documents only.

cReplaceChar

This is a read and write property.

The character used when a character in the source document's character set cannot be mapped to the output character set. The default replacement character is a question mark (?).

cxVectorToRasterXRes

This is a read and write property.

This property controls the horizontal resolution at which presentations and vector graphics are converted. The default value is 0, which means that HTML Export retains the original resolution.

This property is set in conjunction with [cyVectorToRasterYRes, on the next page](#).

You can specify the resolution as an absolute size in pixels, or as a proportion of the original size.

KeyView always maintains the aspect ratio of the original graphic and does not increase the resolution. If you set values that would enlarge a graphic, KeyView only changes the size of the HTML element.

To set the resolution in pixels

To specify the resolution in pixels, specify the width (`cxVectorToRasterXRes`) and/or height (`cyVectorToRasterYRes`).

To export the largest image that fits within a bounding box, without changing the original aspect ratio, set both the width and height. For example, to export the largest image that fits in an 800x500 bounding box:

```
cxVectorToRasterXRes=800  
cyVextorToRasterYRes=500
```

Alternatively you can fix one of the dimensions. Set one value and set the other to zero. For example, to export images with a height of 1500 pixels and whatever width is necessary to maintain the original aspect ratio:

```
cxVectorToRasterXRes=0  
cyVextorToRasterYRes=1500
```

The maximum size permitted for either dimension is 4000 pixels.

To set the resolution proportionally

To set the resolution proportionally, set `cxVectorToRasterXRes` to a negative value. A negative value represents a percentage of the original resolution. Set `cyVectorToRasterYRes` to 0 (zero). Negative (percentage) values for `cyVectorToRasterYRes` are ignored.

The following example exports a graphic at 50 percent of its original resolution:

```
cxVectorToRasterXRes=-50  
cyVectorToRasterYRes=0
```

cyVectorToRasterYRes

This is a read and write property.

This property controls the vertical resolution at which presentations and vector graphics are converted. The default value is 0, which means HTML Export retains the original resolution.

This property is set in conjunction with [cxVectorToRasterXRes](#), on the previous page.

You can specify the resolution as an absolute size in pixels, or as a proportion of the original size.

KeyView always maintains the aspect ratio of the original graphic and does not increase the resolution. If you set values that would enlarge a graphic, KeyView only changes the size of the HTML element.

To set the resolution in pixels

To specify the resolution in pixels, specify the width (`cxVectorToRasterXRes`) and/or height (`cyVectorToRasterYRes`).

To export the largest image that fits within a bounding box, without changing the original aspect ratio, set both the width and height. For example, to export the largest image that fits in an 800x500 bounding box:

```
cxVectorToRasterXRes=800  
cyVextorToRasterYRes=500
```

Alternatively you can fix one of the dimensions. Set one value and set the other to zero. For example, to export images with a height of 1500 pixels and whatever width is necessary to maintain the original aspect ratio:

```
cxVectorToRasterXRes=0  
cyVextorToRasterYRes=1500
```

The maximum size permitted for either dimension is 4000 pixels.

To set the resolution proportionally

To set the resolution proportionally, set `cxVectorToRasterXRes` to a negative value. A negative value represents a percentage of the original resolution. Set `cyVectorToRasterYRes` to 0 (zero). Negative (percentage) values for `cyVectorToRasterYRes` are ignored.

The following example exports a graphic at 50 percent of its original resolution:

```
cxVectorToRasterXRes=-50  
cyVectorToRasterYRes=0
```

dwFlags

This is a read and write property.

Instructions on how to process the content associated with a paragraph or character style. See [Flags for Defining Styles, on page 83](#) for descriptions of each flag.

NOTE: The value of `Flags` in the template files is used in `dwFlags`.

This property applies to word processing documents only.

FontSizeMap_nSize[1...7]

This is a read and write property.

The font sizes to which the HTML tags `` through `` correspond. If you set `bSupportUserFontSizeMapping` to `FALSE`, this parameter can be left blank.

The values in `FontSizeMap` indicate the range for the HTML tag ``. For example if you specify 6, 9, 12, 18, 21, 24, and 28:

- font size 6 in the source document is mapped to `` in the output HTML
- font size 9 in the source document is mapped to `` in the output HTML
- font size 12 in the source document is mapped to `` in the output HTML
- and so on, up to ``

When the HTML output is viewed, the browser maps `` to a specific font size.

The default font sizes are 8, 10, 12, 14, 18, 24, and 36.

headingCreateType

This is a read and write property.

This property determines how HTML Export subdivides the source document into table of contents entries. This should be set to one of the two options that are enumerated in `KVHeadingCreateOptions` in `kvhtml.h`. The determination of table of contents entries is based on whether the source document contains *heading styles* or whether *text attributes* (bold, underlined, italic, and so on) conform to the criteria defined in `KVHTMLHeadingInfo`. Heading styles are predefined style tags, such as "Heading 1" and "Heading 2" tags in a Microsoft Word document.

This property applies to word processing documents only. The enumerated types are described below.

KVHC_DocHeadingsOnly

This instructs HTML Export to rely exclusively on heading styles defined in the source document. However, if the source document does not contain heading styles, HTML Export generates blocks on its own by using the criteria defined by the parameters in `KVHTMLHeadingInfo`.

KVHC_CreateHeadingsAlways

This instructs HTML Export to use the heading styles in the source document when available, and to also automatically create table of contents entries based on the criteria defined by the parameters in KVHTMLHeadingInfo.

NOTE: Note: When the determination of table of contents entries is based on text attributes, source text must meet *all* the criteria defined by the parameters of KVHTMLHeadingInfo before it is converted to a heading and included as a table of contents entry.

InputCharSet

This is a read-only property.

The character set of the source document if that information is ascertainable. The character sets that are available are enumerated in KVCharSet of kvtypes.h.

IcbBlockSize

This is a read and write property.

The maximum size (in bytes) of heading level 1 HTML output files. This number is used as a guideline and can be exceeded to break content at a logical location. This setting is not used when exporting spreadsheets.

IcbMaxMemUsage

This is a read and write property.

The maximum memory allocated dynamically for token buffers during file processing. If this maximum is reached, Export performs a swap-to-disk operation internally, and then reuses the memory blocks. Export maintains an internal minimum memory size.

This property applies to word processing or text documents only.

The default is LONG_MAX. The unit is in bytes.

MarkUpEnd

This is a read and write property.

The markup to be added to the end of a paragraph or character style. See [Map Styles, on page 81](#) for more information on mapping styles.

This property applies to word processing documents only.

MarkUpStart

This is a read and write property.

The markup to be added to the beginning of a paragraph or character style. See [Map Styles, on page 81](#) for more information on mapping styles.

This property applies to word processing documents only.

nCompressionQuality

This is a read and write property.

This property controls the output quality of graphics that support compression quality (for example, JPEG). A value of 0 means default quality (85 compression), 1 is the lowest quality (highest compression and therefore smallest file size), and 100 is the highest quality (no compression and therefore the largest file size).

This property applies to word processing documents only.

nRowsBeforeSplit

This is a read and write property.

The approximate number of spreadsheet rows to be processed before splitting a table. This helps to prevent large spreadsheet tables from occurring in a single document, which can cause speed and processing problems for the browser.

This property applies to spreadsheets only.

nTableBorderWidth

This is a read and write property.

This property sets the width of the table border in pixels.

This property applies to word processing documents only.

NumStyles

The number of developer-defined styles to be used by HTML Export in formatting Cascading Style Sheet (CSS) information passed by the source document.

See [AddStyleMapping, on page 247](#), [GetStyleMapping, on page 248](#), and [RemoveStyleMapping, on page 250](#) for more information.

This property applies to word processing documents only.

OutputCharSet

This is a read and write property.

The character set to use for textual output if the document character set cannot be determined from the document, and the input character set is not specified by `SrcCharSet`. To ensure that the source character set defined here is used, you must set `bForceOutputCharSet` to `TRUE`. The character sets that are available are enumerated in `KVCharSet` in `kvtypes.h`. See [Convert Character Sets, on page 76](#) for more information on mapping character sets.

[Supported Formats, on page 276](#) lists the file formats for which character set information can be determined.

OutputLanguageID

This is a read and write property.

The language for the textual output of language-specific data like time and date. Note that `OutputLanguageID` must be in the system locale. If `OutputLanguageID` is invalid or not supplied, the system default is used. Language IDs are enumerated in `KVLanguageID` in `kvtypes.h`.

OutputRasterGraphicType

This is a read and write property.

The output format of rasterized embedded graphics. There are six options enumerated in `KVHTMLGraphicType` in `kvhtml.h`. The default is JPEG.

OutputVectorGraphicType

This is a read and write property.

The output format of vector graphics. The options are enumerated in `KVHTMLGraphicType` in `kvhtml.h`. The default is JPEG.

For more information on displaying vector graphics, see [Display Vector Graphics on UNIX and Linux, on page 84](#).

pHn_bNoMultiSpaces

This is a read and write property.

This is one of the criteria used to determine whether source text should be converted to a heading in the HTML output. If you set `pHn_bNoMultiSpaces` to `TRUE`, the text in the source document must *not* contain two or more contiguous white spaces in order for HTML Export to consider converting it to a heading. The default is `FALSE`.

To determine whether source text should be converted to a heading, HTML Export also considers whether the text meets the criteria defined by the other parameters of `KVHTMLHeadingInfo`.

See [headingCreateType, on page 260](#) for more information on automatic generation of headings.

For this property, *n* can be heading level 1 through 6.

pHn_bNonZeroIndent

This is a read and write property.

This is one of the criteria used to determine whether source text should be converted to a heading in the HTML output. If you set `pHn_bNonZeroIndent` to `TRUE`, the text in the source document must be indented in order for HTML Export to consider converting it to a heading. If you set `pHn_bNonZeroIndent` to `FALSE`, the text must be aligned left. The default is `FALSE`.

To determine whether source text should be converted to a heading, HTML Export also considers whether the text meets the criteria defined by the other parameters of `KVHTMLHeadingInfo`.

See [headingCreateType, on page 260](#) for more information on automatic generation of headings.

For this property, *n* can be heading level 1 through 6.

pHn_bNoTabs

This is a read and write property.

This is one of the criteria used to determine whether source text should be converted to a heading in the HTML output. If you set `pHn_bNoTabs` to `TRUE`, the text in the source document must *not* contain tabs in order for HTML Export to consider converting it to a heading. The default is `FALSE`.

To determine whether source text should be converted to a heading, HTML Export also considers whether the text meets the criteria defined by the other parameters of `KVHTMLHeadingInfo`.

See [headingCreateType, on page 260](#) for more information on automatic generation of headings.

For this property, *n* can be heading level 1 through 6.

pHn_bMustBeBold

This is a read and write property.

This is one of the criteria used to determine whether source text should be converted to a heading in the HTML output. If you set `pHn_bMustBeBold` to `TRUE`, the text in the source document must be bold in order for HTML Export to consider converting it to a heading. The default is `TRUE`.

To determine whether source text should be converted to a heading, HTML Export also considers whether the text meets the criteria defined by the other parameters of `KVHTMLHeadingInfo`.

See [headingCreateType, on page 260](#) for more information on automatic generation of headings.

For this property, *n* can be heading level 1 through 6.

pHn_bMustBeItalic

This is a read and write property.

This is one of the criteria used to determine whether source text should be converted to a heading in the HTML output. If you set `pHn_bMustBeItalic` to `TRUE`, the text in the source document must be italic in order for HTML Export to consider converting it to a heading. The default is `TRUE`.

To determine whether source text should be converted to a heading, HTML Export also considers whether the text meets the criteria defined by the other parameters of `KVHTMLHeadingInfo`.

See [headingCreateType, on page 260](#) for more information on automatic generation of headings.

For this property, *n* can be heading level 1 through 6.

pHn_bMustBeUnderlined

This is a read and write property.

This is one of the criteria used to determine whether source text should be converted to a heading in the HTML output. If you set `pHn_bMustBeUnderlined` to `TRUE`, the text in the source document must be underlined in order for HTML Export to consider converting it to a heading. The default is `TRUE`.

To determine whether source text should be converted to a heading, HTML Export also considers whether the text meets the criteria defined by the other parameters of `KVHTMLHeadingInfo`.

See [headingCreateType, on page 260](#) for more information on automatic generation of headings.

For this property, *n* can be heading level 1 through 6.

pHn_fontSizeMax

This is a read and write property.

This is one of the criteria used to determine whether source text should be converted to a heading in the HTML output. It specifies the maximum font size that text in the source document can be in order for HTML Export to consider converting it to a heading. The default is 20 for heading level 1 and 14 for heading levels 2 to 6.

To determine whether source text should be converted to a heading, HTML Export also considers whether the text meets the criteria defined by the other parameters of `KVHTMLHeadingInfo`.

See [headingCreateType, on page 260](#) for more information on automatic generation of headings.

For this property, *n* can be heading level 1 through 6.

pHn_fontSizeMin

This is a read and write property.

This is one of the criteria used to determine whether source text should be converted to a heading in the HTML output. It specifies the minimum font size that text in the source document can be in order for HTML Export to consider converting it to a heading. The default is 14 for heading level 1 and 14 for heading levels 2 to 6.

To determine whether source text should be converted to a heading, HTML Export also considers whether the text meets the criteria defined by the other parameters of `KVHTMLHeadingInfo`.

See [headingCreateType, on page 260](#) for more information on automatic generation of headings.

For this property, n can be heading level 1 through 6.

pH n _maxParaLen

This is a read and write property.

This is one of the criteria used to determine whether source text should be converted to a heading in the HTML output. It specifies the maximum number of characters that text in the source document can contain in order for HTML Export to consider converting it to a heading. The default is 80.

To determine whether source text should be converted to a heading, HTML Export also considers whether the text meets the criteria defined by the other parameters of `KVHTMLHeadingInfo`.

See [headingCreateType, on page 260](#) for more information on automatic generation of headings.

For this property, n can be heading level 1 through 6.

This property applies to word processing documents only.

pH n _minParaLen

This is a read and write property.

This is one of the criteria used to determine whether source text should be converted to a heading in the HTML output. It specifies the minimum number of characters that text in the source document can contain in order for HTML Export to consider converting it to a heading. The default is 3.

To determine whether source text should be converted to a heading, HTML Export also considers whether the text meets the criteria defined by the other parameters of `KVHTMLHeadingInfo`.

See [headingCreateType, on page 260](#) for more information on automatic generation of headings.

For this property, n can be heading level 1 through 6.

This property applies to word processing documents only.

pH n _mSpaceAfter

This is a read and write property.

This is one of the criteria used to determine whether source text should be converted to a heading in the HTML output. It specifies the amount of space in TWIPS (20th of a point) that must follow a paragraph in the source document in order for HTML Export to consider converting the paragraph to a heading. If –1 is used, the amount of space after the paragraph is not considered in the heading generation.

To determine whether source text should be converted to a heading, HTML Export also considers whether the text meets the criteria defined by the other parameters of `KVHTMLHeadingInfo`.

See [headingCreateType, on page 260](#) for more information on automatic generation of headings.

For this property, n can be heading level 1 through 6.

This property applies to word processing documents only.

pH n _mSpaceBefore

This is a read and write property.

This is one of the criteria used to determine whether source text should be converted to a heading in the HTML output. It specifies the amount of space in TWIPS (20th of a point) that must come before a paragraph in the source document in order for HTML Export to consider converting the paragraph to a heading. If -1 is used, the amount of space before the paragraph is not considered in the heading generation.

To determine whether source text should be converted to a heading, HTML Export also considers whether the text meets the criteria defined by the other parameters of `KVHTMLHeadingInfo`.

For this property, n can be heading level 1 through 6.

This property applies to word processing documents only.

pszAuthor

The contents of the Author property field taken from the source document.

See [GetSummaryInfo, on page 249](#) for more information on all metadata that you can obtain from a document.

pszBaseURL

This is a read and write property.

The base URL that replaces the `$BASE` token in the HTML output.

pszComments

The contents of the Comments property field taken from the source document.

See [GetSummaryInfo, on page 249](#) for more information on all metadata that you can obtain from a document.

pszChunkTemplate

This is a read and write property.

If an H1 HTML block is subdivided into separate files as a result of the size limitations specified in `lcbBlockSize`, `pszChunkTemplate` provides a template for creating a table of contents entry for the new file. The chunk number can be made a part of this template by inserting the token `$SPLITBLOCKNUMBER` (for example, "Page `$SPLITBLOCKNUMBER`").

pszDefaultOutputDirectory

This is a read and write property.

The default output directory for auxiliary files that are created. The default is the directory in which your application is running.

pszEndBlock

This is a read and write property.

The markup and HTML Export tokens to be output at the end of each block created as a result of the of `lcbBlockSize` or `bHardPageMakesNewBlock`.

pszFirstH1End

This is a read and write property.

The markup and HTML Export tokens to include in the output at the end of the first H1 HTML block created, that is, the block associated with the first H1 table of contents entry.

pszFirstH1Start

This is a read and write property.

The markup and HTML Export tokens to include in the output at the beginning of the first H1 HTML block created, that is, the block associated with the first H1 table of contents entry.

pszH[2..6]HTML

This is a read and write property.

The markup and HTML Export tokens to include in the output in an HTML block for heading levels 2 through 6.

pszInputFile

This is a read and write property.

The full path and file name of the file that is converted to HTML, or has its metadata or format information extracted. You must set this property for the conversion to proceed.

pszKeyViewDir

This is a read and write property.

The location of the directory where HTML Export is installed. If this property is NULL, required components might not be found.

pszKeywords

This is a read-only property.

The contents of the Keywords property field taken from the source document.

See [GetSummaryInfo, on page 249](#) for more information on all metadata that you can obtain from a document.

pszLastH1End

This is a read and write property.

The markup and HTML Export tokens to include in the output at the end of the last H1 HTML block created, that is, the block associated with the last H1 table of contents entry.

pszLastH1Start

This is a read and write property.

The markup and HTML Export tokens to include in the output at the beginning of the last H1 HTML block created, that is, the block associated with the last H1 table of contents entry.

pszLastSavedby

This is a read-only property.

The contents of the "Last Saved by" field taken from the source document.

See [GetSummaryInfo, on page 249](#) for more information on all metadata that you can obtain from a document.

pszMainBottom

This is a read and write property.

The markup and tokens to include in the output at the end of the main HTML file created during document conversion. This parameter should at least contain the `</html>` tag.

pszMainTop

This is a read and write property.

The markup and tokens to include in the output at the start of the main HTML file created during document conversion. Most of the template files feature `<meta>` tags with tokens that store the input document's metadata. This parameter should at least contain the `<html>` tag. For frames-style HTML output, this parameter must include the `<frame>` tag.

pszMainURL

This is a read and write property.

The URL that replaces the `$MAINURL` token in the HTML output.

pszMiddleH1End

This is a read and write property.

The markup and HTML Export tokens to include in the output at the end of those H1 HTML blocks that are neither the first nor the last H1 blocks created, that is, blocks that are associated with all but the first and last H1 table of contents entry.

pszMiddleH1Start

This is a read and write property.

The markup and HTML Export tokens to include in the output at the beginning of those H1 HTML blocks that are neither the first nor the last H1 blocks created, that is, blocks that are associated with all but the first and last H1 table of contents entry.

pszPicPath

This is a read and write property.

The output directory for picture files created during the conversion. The default is the directory in which your application is running.

If specified, this parameter can also be used by the callback functions `KVHTMLGetAnchorEx` and `KVHTMLGetAuxOutputEx`.

This property applies to word processing documents only.

pszPicURL

This is a read and write property.

The URL of the picture files created from embedded graphics in the source document.

This property applies to word processing documents only.

pszRevNumber

This is a read-only property.

The contents of the Revision number property field taken from the source document.

See [GetSummaryInfo, on page 249](#) for more information on all metadata that you can obtain from a document.

pszStartBlock

This is a read and write property.

The markup and HTML Export tokens to include in the output at the beginning of each block created as a result of `lcbBlockSize` or `bHardPageMakesNewBlock`.

pszSubject

This is a read-only property.

The contents of the Subject property field taken from the source document.

See [GetSummaryInfo, on page 249](#) for more information on all metadata that you can obtain from a document.

pszTableHTML

This is a read and write property.

Specifies the markup (no tokens) output at the beginning of each table created during the HTML conversion process. If you set this property, table cell color and border information from the document is ignored. This property is used in conjunction with `bTableHTMLForSpreadsheetOnly` to control the look of generated spreadsheets.

For example, to set the tables to be centered, colored, and with big borders, use:

```
pszTableHTML=<table bgcolor="teal" border="13" align="center">
```

pszTemplate

This is a read-only property.

The contents of the Template property field taken from the source document.

See [GetSummaryInfo, on page 249](#) for more information on all metadata that you can obtain from a document.

pszTitle

This is a read-only property.

The contents of the Title property field taken from the source document.

See [GetSummaryInfo](#), on page 249 for more information on all metadata that you can obtain from a document.

pszTOC_H[1..6]

This is a read and write property.

The markup and HTML Export tokens required to process the table of contents entries for heading levels 1 through 6. For example:

```
<a href="$ANCHOR" target="right">$TOCTE</a>
```

pszTOCH[1..6]End

This is a read and write property.

The markup and HTML Export tokens to include in the output at the end of a table of contents block for heading levels 1 through 6 TOC entries. An example of `pszTOCH[1..6]End` is `</o1>`.

pszTOCH[1..6]LeafNode

This is a read and write property.

The markup that replaces `pszTOC_H[1..6]` entries for leaf nodes in the table of contents. A leaf node is a node that has no children.

pszTOCH[1..6]Start

This is a read and write property.

The markup and HTML Export tokens to include in the output at the beginning of a table of contents block for heading levels 1 through 6 TOC entries. An example of `pszTOC_H[1..6]Start` would be `<o1 type=I>`.

pszUserSummary

This is a read and write property.

The markup and tokens that are generated when the tokens `$USERSUMMARY`, `$SUMMARY`, or `$SUMMARYNN` are used. For example:

```
"<meta title="$SUMMARY01" author="$SUMMARY03"/>"
```

pszXFile

This is a read and write property.

The markup and HTML Export tokens that are generated and placed in an extra HTML file. This file holds content from the source document (for example, a separate file containing \$TOC that can be displayed within an HTML frame). To process this file, use the \$XANCHOR token. See [Export Tokens, on page 359](#) for more information on \$XANCHOR.

For example, if the extra file is to contain the table of contents in frame-based HTML, set pszXFile to \$TOC and place the following HTML markup in the pszMainTop element:

```
<frame src="$XANCHOR" name="left" scrolling="auto" target="right">.
```

pszXStartBlock

This is a read and write property.

The markup and tokens to include in the output at the beginning of each HTML block generated by the \$XANCHOR token. If either this parameter or pszXEndBlock is defined, both pszStartBlock and pszEndBlock are ignored. See [Export Tokens, on page 359](#) for more information on \$XANCHOR.

pszXEndBlock

This is a read and write property.

The markup and tokens to include in the output at the end of each HTML block generated by the \$XANCHOR token. If either this parameter or pszXStartBlock is defined, both pszStartBlock and pszEndBlock are ignored. See [Export Tokens, on page 359](#) for more information on \$XANCHOR.

SATableBorder

This is a read and write property.

This property specifies whether table borders in the HTML output are based on the setting in the source document, are always on, or are always off. The options are enumerated in ENSATableBorder of kvtypes.h.

This property applies to word processing documents only.

SrcCharSet

This is a read and write property.

This property specifies the source character set if the reader for the document type cannot determine the character set. To ensure that the source character set defined here is used, you might have to set

bForceSrcCharSet to **TRUE**. The character sets that are available are enumerated in `KVCharSet` of `kvtypes.h`. See [Convert Character Sets, on page 76](#) for more information on character set mapping.

The section [Supported Formats, on page 276](#) lists the file formats for which character set information can be determined.

StyleSheetType

This is a read and write property.

One of the three enumerated options for processing style sheet information.

- To disable style sheet formatting, set `StyleSheetType` to **STYLESHEET_DISABLED**.
- To enable Cascading Style Sheet (CSS) formatting and output the generated formatting data within the HTML output stream, set `StyleSheetType` to **CSS_INLINE**.
- To enable CSS formatting and output the generated formatting data in an external CSS file referenced in the HTML output as a tag, set `StyleSheetType` to **CSS_TOFILE**.

Refer to [KVHTMLStyleSheetType, on page 233](#) for more information on these enumerated options.

StyleName

This is a read and write property.

The name of the word processing style (for example, "Heading 1") to which style mapping is applied. Style names are case sensitive. See [Map Styles, on page 81](#) for more information on mapping styles.

This property applies to word processing documents only.

Timeout

This is a read and write property.

The number of seconds that HTML Export should allow for converting a source document before killing the process. This property guards against hung processes. Setting this property to **-1** deprives HTML Export of a timeout guideline, that is, no processes are terminated. This property applies only to the out-of-process COM object.

Part V: Appendixes

This section lists supported formats, supported character sets and redistributed files, and provides information on format detection.

- [Supported Formats](#)
- [Character Sets](#)
- [File Formats and Extensions](#)
- [Extract and Format Lotus Notes Subfiles](#)
- [Export Tokens](#)
- [File Format Detection](#)
- [Files Required for Redistribution](#)
- [Password Protected Files](#)

Appendix A: Supported Formats

This section lists information about the file formats that can be detected and processed (either filtered, converted, or displayed) by the KeyView suite of products. The KeyView suite includes KeyView Filter SDK, KeyView Export SDK, and KeyView Viewing SDK.

- [Supported Formats](#) 276
- [Supported Formats \(Detected\)](#) 301

Supported Formats

The tables in this section provide the following information:

- The file formats supported by the Filter API, Export API, Viewing API, and File Extraction API. The supported versions and the format's extension are also listed.

The formats listed in this section can also be detected by the KeyView format detection module (kwad). The [Supported Formats \(Detected\)](#) section lists formats that can be detected, but cannot be filtered, converted, or displayed.

- The file formats for which KeyView can detect and extract the character set and metadata information (properties such as title, author, and subject).

Even though a file format might be able to provide character set information, some documents might not contain character set information. Therefore, the document reader would not be able to determine the character set of the document. In this case, either the operating system code page or the character set specified in the API is used.

- The document reader used to filter each format.

Key to Support Tables

Symbol	Description
Y	The format is supported. You can extract metadata for this format. You can determine the character set for this format.
N	The format is not supported. You cannot extract metadata for this format. You cannot determine the character set for this format.
P	Partial metadata is extracted from this format. Some non-standard fields are not extracted.
T	Only text is extracted from this format. Formatting information is not extracted.
M	Only metadata (title, subject, author, and so on) is extracted from this format. Text and

²On non-Windows platforms, graphic rendering is supported through the kpDXFrdr reader for versions R13, R14, R15, and R18 (2004); for other versions, only text extraction is supported.

³On Windows platforms, kpODArdr is used for all versions up to 2007 and graphic rendering is supported; for later versions, only text extraction is supported through the kpDWGrdr or kpDXFrdr reader.

⁴All CAT file extensions, for example CATDrawing, CATProduct, CATPart, and so on.

⁵Viewing and Export use the graphic reader, kpVSD2rdr for Microsoft Visio 2003, 2007, and 2010, and vsdsr for all earlier versions. Image fidelity in Viewing and Export is therefore only supported for versions 2003 and above. Filter uses the graphic reader kpVSD2rdr for Microsoft Visio 2003, 2007, and 2010, and vsdsr for all earlier versions.

⁶Extraction of embedded OLE objects is supported for Filter on Windows platforms only.

⁷Visio 2013 is supported in Viewing only, with the support of ActiveX components from the Microsoft Visio 2013 Viewer. Image fidelity is supported but other features, such as highlighting, are not.

Multimedia Formats

Viewing SDK plays some multimedia files using the Windows Media Control Interface (MCI). MCI is a set of Windows APIs that communicate with multimedia devices.

¹This reader supports both clear signed and encrypted S/MIME. KeyView supports S/MIME for PST, EML, MBX, and MSG files.

²Uses Microsoft Messaging Application Programming Interface (MAPI). Note that the native PST reader (*pstsr*) works only on Windows, and requires that you have Microsoft Outlook installed. As an alternative, the MAPI reader (*pstnsr*) runs on all platforms, and does not require Microsoft Outlook. For more information on using the native PST reader or the MAPI reader, see the sections 'Use the Native PST Reader (*pstnsr*)' and 'Use the MAPI Reader (*pstsr*)' in Chapter 3.

³This reader supports both clear signed and encrypted S/MIME. KeyView supports S/MIME for PST, EML, MBX, and MSG files.

⁴This reader supports both clear signed and encrypted S/MIME. KeyView supports S/MIME for PST, EML, MBX, and MSG files.

Supported Multimedia Formats

QuickTime Movie	2, 3, 4	MCI	QT MOV	N	N	Y	N	N	N	N
Windows Video	2.1	MCI	AVI	N	N	Y	N	N	N	N

NOTE:

Depending on the default multimedia player installed on your computer, the View API might not be able to play some supported multimedia formats. To play multimedia files, the View API uses the Windows Media Control Interface (MCI) to communicate with the multimedia

player installed on your computer. If the player does not play a multimedia file that is supported by the Viewing SDK, the View API cannot play the file.

If you cannot play a supported multimedia file by using the View API, install a different multimedia player or compressor/decompressor (codec) component.

¹To successfully use this reader, you must set the KV_YAHOO_ID environment variable to the Yahoo user ID. You can optionally set the KV_OTHER_YAHOO_ID environment variable to the other Yahoo user ID. If you do not set it, "Other" is used by default. If you enter incorrect values for the environment variables, erroneous data is generated.

Supported Formats (Detected)

The file formats listed in this section can be detected by the KeyView format detection module (`kwad`), but cannot be filtered, converted, or displayed. The detection module determines a file's format and reports the information to the developer's application.

The formats listed in [Supported Formats, on page 276](#) can be detected as well as filtered, exported, and viewed.

Appendix B: Character Sets

This section provides information on the handling of character sets in the KeyView suite of products, which includes KeyView Filter SDK, KeyView Export SDK, and KeyView Viewing SDK.

- [Multibyte and Bidirectional Support](#) 308
- [Coded Character Sets](#) 316

Multibyte and Bidirectional Support

The KeyView SDKs can process files that contain multibyte characters. A multibyte character encoding represents a single character with consecutive bytes. KeyView can also process text from files that contain bidirectional text. Bidirectional text contains both Latin-based text which is read from left to right, and text that is read from right to left (Hebrew and Arabic).

The following table indicates which character encodings are supported by KeyView for each format.

Multibyte and bidirectional support

Format	Single-byte	Multibyte	Bidirectional
Archive			
7-Zip (7Z)	n/a	n/a	n/a
AD1 Evidence file	n/a	n/a	n/a
ADJ	n/a	n/a	n/a

1

Multibyte PDFs are supported, provided the PDF document is created by using either Character ID-keyed (CID) fonts, predefined CJK CMap files, or ToUnicode font encodings, and does not contain

embedded fonts. See the Adobe website and the Adobe Acrobat documentation for more information. Any multibyte characters that are not supported are displayed using the replacement character. By default, the replacement character is a question mark (?).

To determine the type of font encodings that are used in a PDF, open the PDF in Adobe Acrobat, and select **File > Document Info > Fonts**. If the Encoding column lists Custom or Embedded encodings, you might encounter problems converting the PDF.

2

The text direction in the output file might not be correct.

3

In Export SDK, a bidirectional right-to-left (RTL) tag is extracted from this format and included in the direction element (<dir=RTL>) of the output.

Coded Character Sets

This section lists which character set you can use to specify the target character set. The coded character sets are enumerated in `kvtypes.h` and defined in the Export class.

Code Character Sets

Coded Character Set	Description	Can be set as target charset?
KVCS_UNKNOWN	Unknown character set	N
KVCS_SJIS	Japanese (uses multibyte encoding), cp932	Y
KVCS_GB	Simplified Chinese (China, Singapore, Malaysia) cp936	Y
KVCS_BIG5	Traditional Chinese (Taiwan, Hong Kong, Macaw) cp950	Y
KVCS_KSC	Korean, cp949	Y
KVCS_1250	Windows Latin 2 (Central Europe)	Y
KVCS_1251	Windows Cyrillic (Slavic)	Y
KVCS_1252	Windows Latin 1 (ANSI)	Y
KVCS_1253	Windows Greek	Y
KVCS_1254	Windows Latin 5 (Turkish)	Y
KVCS_1255	Windows Hebrew	Y
KVCS_1256	Windows Arabic	Y
KVCS_1257	Windows Baltic Rim	Y

Code Character Sets, continued

Coded Character Set	Description	Can be set as target charset?
KVCS_1258	Windows Vietnamese	Y
KVCS_8859_1	ISO 8859-1 Latin 1 (Western Europe, Latin America)	Y
KVCS_8859_2	ISO 8859-2 Latin 2 (Central Eastern Europe)	Y
KVCS_8859_3	ISO 8859-3 Latin 3 (S.E. Europe)	Y
KVCS_8859_4	ISO 8859-4 Latin 4 (Scandinavia/Baltic)	Y
KVCS_8859_5	ISO 8859-5 Latin/Cyrillic	Y
KVCS_8859_6	ISO 8859-6 Latin/Arabic	Y

1

The character set cannot be forced as output in Export SDK and Viewing SDK because the character set is not supported by the major browsers.

Appendix C: File Formats and Extensions

This section lists the KeyView file format numbers and their associated file extensions.

- [File Format and Extension Table](#)321

File Format and Extension Table

This section lists the KeyView file format codes and the file extensions that they are most commonly associated with.

NOTE: This is not a complete list of file extensions. KeyView returns format codes based on file content, which cannot always be predicted from the file extension. Some file extensions might also be associated with multiple format numbers.

KeyView file formats and extensions

Format Name	Format Number	Format Description	Associated File Extension
AES_Multiplus_Comm_Fmt	1	Multiplus (AES)	PTF
ASCII_Text_Fmt	2	Text	
MSDOS_Batch_File_Fmt	3	MS-DOS Batch File	BAT
Applix_Alis_Fmt	4	APPLIX ASTERIX	AX
BMP_Fmt	5	Windows Bitmap	BMP
CT_DEF_Fmt	6	Convergent Technologies DEF Comm. Format	
Corel_Draw_Fmt	7	Corel Draw	CDR
CGM_ClearText_Fmt	8	Computer Graphics Metafile (CGM)	CGM ¹
CGM_Binary_Fmt	9	Computer Graphics Metafile (CGM)	CGM ¹
CGM_Character_Fmt	10	Computer Graphics Metafile (CGM)	CGM ¹
Word_Connection_Fmt	11	Word Connection	CN
COMET_TOP_Word_Fmt	12	COMET TOP	

KeyView file formats and extensions, continued

Format Name	Format Number	Format Description	Associated File Extension

1

This file extension can return more than one format number.

2

MHT, EML, and MBX files might return either format 2, 233, or 395, depending on the text in the file. In general, files that contain fields such as To, From, Date, or Subject are considered to be email messages; files that contain fields such as content-type and mime-version are considered to be MHT files; and files that do not contain any of those fields are considered to be text files.

3

All CAT file extensions, for example CATDrawing, CATProduct, CATPart, and so on.

Appendix D: Extract and Format Lotus Notes Subfiles

This section describes how to create XML templates to alter the appearance of extracted Lotus mail note subfiles so that they maintain the look and feel of the original notes.

- [Overview](#) 346
- [Customize XML Templates](#) 346
- [Template Elements and Attributes](#) 348
- [Date and Time Formats](#) 352

Overview

KeyView uses the NSF reader, `nsfsr`, to extract Lotus database files, and places Lotus mail notes in subfiles. The NSF reader uses a set of default XML templates to extract the notes and apply formatting, thereby approximating the look and feel of the original notes.

In some cases, you might need to customize the XML templates, for instance if your notes contain custom data. In such cases, you can modify the existing XML templates or create your own.

During extraction, the NSF reader loads all XML files in the `NSFtemplates` directory and its subdirectories (except for the `NSFtemplates\images` directory, which is reserved for images). During initialization, the KeyView XML parser verifies the XML templates. If the templates contain any invalid XML, elements, or attributes, initialization fails and errors are recorded in the `nsfsr.log` file.

Customize XML Templates

XML templates are enabled by default. In most cases, the default templates should be sufficient; however, you can customize them or create your own as required.

To customize XML templates for Lotus note extraction

1. Modify the template files in the following directory.
`install\OS\bin\NSFtemplates`
The `main.xml` file must exist in the `NSFtemplates` directory. It is the top-level template file that extracts all subfiles, usually by calling other templates.
2. Make sure that any modifications or additional XML files conform to the supported elements and attributes described in [Template Elements and Attributes, on page 348](#).
3. Extract the Lotus database file.

Use Demo Templates

For testing purposes, you can extract notes by using a set of demo templates, which are provided to demonstrate the proper usage of all the XML elements and attributes, because the default templates do not use all the XML elements.

The demo templates are available at:

install\OS\bin\NSFtemplates

To use the demo XML templates

1. In the `formats.ini` file, set the following parameter.

```
[nsfsr]
UseDemoTemplate=1
```

2. In the `main.xml` file, uncomment the following section.

```
<ifini name="UseDemoTemplate" text="1">
  <call file="demo.xml"/>
</ifini>
```

Use Old Templates

For testing purposes, you can extract notes by using legacy templates, which produce MHTML output. You can generate similar output by disabling the XML templates, but using the old templates enables you to see the XML code and compare it to the standard and demo templates.

To use the old XML templates

1. In the `formats.ini` file, set the following parameter.

```
[nsfsr]
UseOldTemplate=1
```

2. In the `main.xml` file, uncomment the following section.

```
<ifini name="UseOldTemplate" text="1">
  <call file="default_old.xml">
</ifini>
```

Disable XML Templates

For testing purposes, you can disable XML templates; KeyView extracts the notes in MHTML format. You can compare the MHTML output directly by the NSF reader with the MHTML output indirectly by the NSF reader through the XML templates.

To disable XML templates

1. In the `formats.ini` file, set the following parameter.

```
[nsfsr]  
ExtractByTemplate=0
```

Template Elements and Attributes

This section lists the valid XML elements and attributes that you can use when creating or modifying templates. See the demo templates for examples.

Conditional Elements

The following table lists the valid conditional elements.

Conditional elements

Element	Description
<keyview>	The KeyView XML template container ("root") element
<if*>	<p>If the condition from the comparison is true, process the XML. Conditions can be nested up to 25 levels deep.</p> <p>Attributes</p> <ul style="list-style-type: none">• <code>name</code>. (Required) The name of the main item to compare to <code>item</code> or <code>text</code>.• <code>item</code>. (Required if no <code>text</code>) The name of the item to compare to the item specified by <code>name</code>.• <code>text</code>. (Required if no <code>item</code>) The text to compare to the item specified by <code>name</code>.
<ifex>, <ifnx>	<p>If <code>name</code> item exists and has a <code>text</code> value or not.</p> <p>The Notes item might have a value that cannot be converted to text, such as an image.</p>
<ifeq>, <ifne>, <iflt>, <ifle>, <ifgt>, <ifge>	<p>Respectively, if <code>text</code> ==, !=, <, >, <=, >, >=.</p> <p>Text comparison uses a case-insensitive string compare.</p>
<iftdeq>, <iftdne>, <iftdlt>, <iftdle>, <iftdgt>, <iftdge>	<p>Respectively, if time/date ==, !=, <, >, <=, >, >=.</p> <p>Time/date comparison converts dates to text in local time using the Notes default, <code>TZFMT_NEVER</code>, because Notes also sometimes converts fields to text internally. For example:</p> <p><code>text="06/30/2005 02:52:04 PM"</code></p>
<iftzeq>, <iftzne>	<p>Respectively, if the time zone equals or does not equal the comparison text, for example CDT, EST, and so on.</p>

Conditional elements, continued

Element	Description
<ifini>	If the value of the INI option specified in <code>name</code> equals the <code>text</code> value.
<else>	If the condition from the last <if> or <switch> was false, process XML.
<switch>	<p>If a <code>name</code> value exists, process XML.</p> <p>Attributes</p> <ul style="list-style-type: none"> <code>name</code>. (Required) The name of the main item to compare in <case> subelements.
<case>	<p>If the comparison condition is true, process XML, then stop processing the rest of <switch>.</p> <p>Attributes</p> <ul style="list-style-type: none"> <code>text</code>. (Required) The text to compare to the <code>name</code> item of <switch>.
<default>	If all <case> conditions were false, process XML. This element must be the last element in <switch>, after all the <case> elements. Any <case> elements after the <default> element are ignored.
<for>	<p>If a <code>name</code> value exists, process XML. Process for each part of the <code>name</code> item.</p> <p>Attributes</p> <ul style="list-style-type: none"> <code>name</code>. (Required) The name of the main item. <code>max</code>. (Optional) The maximum index to process. By default, all are processed.
<index>	Output <for> loop index (1-based). <index> is only valid within a <for> element.

Control Elements

The following table lists the valid control elements.

Control Elements

Element	Description
<call>	<p>Call another XML template. You can nest templates up to 10 levels deep.</p> <p>Attributes</p> <ul style="list-style-type: none"> <code>file</code>. (Required) The template file name. This name must be unique.
<log>	<p>Log message to the NSF log file.</p> <p>Attributes</p> <ul style="list-style-type: none"> <code>text</code>. (Required) The text to log.

Control Elements, continued

Element	Description
	<ul style="list-style-type: none"> type. (Optional) The type of log message. The following values are valid: <ul style="list-style-type: none"> ERROR WARN INFO DIAG (the default option) DEBUG DUMP
<quit>	<p>Stop processing the template. Exits without error.</p> <p>Attributes</p> <ul style="list-style-type: none"> text. (Optional) The text to log. type. (Optional) The type of log message. See <log>, on the previous page.
<stop>	<p>Stop processing the template. Exits with an ERROR log message.</p> <p>Attributes</p> <ul style="list-style-type: none"> text. (Required) The text to log.

Data Elements

The following table lists the valid data elements.

Data elements

Element	Description
<text>	<p>Output text.</p> <p>Attributes</p> <ul style="list-style-type: none"> name. (Required if there is no parent) The name of the item to output.
<rich>	<p>Output rich text (MHTML). Images are output in the next part or parts of the MHTML, after the first <HTML> part.</p> <p>Attributes</p> <ul style="list-style-type: none"> name. (Required if there is no parent) The name of the item to output.
<body>	<p>Output the message body in rich text (MHTML). As with <rich>, above, images are output in the next part or parts of the MHTML.</p>
<form>	<p>Output the message form (usually \$Body field) in rich text (MHTML).</p> <p>Attributes</p> <ul style="list-style-type: none"> name. (Required if there is no parent) The name of the item to output.

Data elements, continued

Element	Description
<addr>	<p>Output an address.</p> <p>Attributes</p> <ul style="list-style-type: none"> name. (Required if there is no parent) The name of the item to output. type. (Optional) The type of address to output. Set this attribute to CN (Common Name), which is the only supported type.
<name>	<p>Output the name of the last name item, or in other words the current main item. The item must exist.</p>
<format>	<p>Set the default format for <date> and <date_kv>. This element does not set the <text> format. See Date and Time Formats, on the next page for a list of all Notes and KeyView date and time formats and integer values.</p> <p>Attributes</p> <ul style="list-style-type: none"> format. (Optional. Omit to reset to defaults) The Notes and KeyView date and time format. You can set the following formats: <ul style="list-style-type: none"> TD=int. The Time Date format (TDFMT_*) TS=int. The Time Show format (TSFMT_*) TT=int. The Time Time format (TTFMT_*) TZ=int. The Time Zone format (TZFMT_*) KV=int. The KeyView date and time format <p>where int is an integer value that corresponds to the desired format.</p> <p>Separate multiple formats with commas. For example:</p> <p>format="TD=0,TS=2,TT=1,TZ=1,KV=55"</p>
<date>	<p>Output a Notes date.</p> <p>Attributes</p> <ul style="list-style-type: none"> name. (Required if there is no parent) The name of the item to output. format. (Optional) See <format>, above. You can set the following values: <ul style="list-style-type: none"> TD TS TT TZ
<date_kv>	<p>Output a KeyView date.</p> <p>Attributes</p> <ul style="list-style-type: none"> name. (Required if there is no parent) The name of the item to output. format. (Optional) See <format>, above. You can set the following values: <ul style="list-style-type: none"> TZ

Element	Description
	<ul style="list-style-type: none">◦ KV
<time>	<p>Output a time range, for example 1 hour, 30 minutes.</p> <p>Attributes</p> <ul style="list-style-type: none">• name. (Required if there is no parent) The item name of the start date or time.• item. (Required) The item name of the end date or time.
<zone>	<p>Output a Notes time zone mnemonic, for example MST.</p> <p>Attributes</p> <ul style="list-style-type: none">• name. (Required if there is no parent) The name of date item to output.
<zone_ utc>	<p>Output a time zone as UTC, for example (UTC-06:00).</p>
<logo>	<p>Output the mail header logo.</p> <p>The image link is included in the output; the actual image is output to a different part of the MHTML subfile.</p>
<image>	<p>Output an image.</p> <p>The image link is included in the output; the actual image is output to the MHTML next part, as with <rich>, on page 350 and <body>, on page 350.</p>
<image_ uri>	<p>Output an image URI, in quotation marks. The actual image is output to a different part of the MHTML subfile.</p> <p>Attributes</p> <ul style="list-style-type: none">• link. (Required if there is no file) The image link, such as a form or title name. For example:• link="StdNotesLtr0"• file. (Required if there is no link) The name of the image file. The file must exist in the ../../templates/images directory. For example:• file="boxcheck.gif"

Date and Time Formats

This section lists the supported Notes and KeyView date and time formats for use with <format>, <date>, and <date_kv>.

Lotus Notes Date and Time Formats

This section lists supported Lotus Notes date and time formats, and the integer values that specify each one.

Lotus Notes date and time formats

Format	Integer Value	Description
TDFMT_FULL	0	(The Notes default) Year, month, and day
TDFMT_CPARTIAL	1	Month and day, year if not this year
TDFMT_PARTIAL	2	Month and day
TDFMT_DPARTIAL	3	Year and month
TDFMT_FULL4	4	Four-digit year, month, and day
TDFMT_CPARTIAL4	5	Month and day, four-digit year if not this year
TDFMT_DPARTIAL4	6	Four-digit year and month
TTFMT_FULL	0	(Notes default) Hour, minute, and second
TTFMT_PARTIAL	1	Hour and minute
TTFMT_HOUR	2	Hour
TZGMT_NEVER	0	(Notes default) All time zones are converted to the current time zone
TZGMT_SOMETIMES	1	Show only when outside the current time zone
TZGMT_ALWAYS	2	Show for all time zones
TSFMT_DATE	0	Date
TSFMT_TIME	1	Time
TSFMT_DATETIME	2	(The Notes default) Date and time
TSFMT_CDATETIME	4	Date and time, or time today or time yesterday

KeyView Date and Time Formats

This section lists KeyView date and time formats. The KeyView formats use the following syntax:

Month Month = full month name
 Mon = abbreviated month name
 m = month (number)
 mm = two-digit month (leading 0)

Weekday	Weekday = full weekday name
	Wday = abbreviated weekday name
Year	yy = two-digit year
	yyyy = four-digit year
Day	d = day (number)
	dd = two-digit day (leading 0)
Time	h = 12-hour
	H = 24-hour
	m = minutes
	s = seconds
	P = AM/PM
	p = am/pm
Separators	_ = space
	c = comma
	s = slash
	a = dash
	o = dot

KeyView date and time formats

Format	Output	Integer Value

Appendix E: Export Tokens

This section contains an alphabetized list of the Export tokens.

Tokens are special strings inserted into the `KVHTMLTemplateEx` structure, `HtmlTemplateInfo` class, and template files. They are placeholders for markup that appears in the HTML output. For example, the `$CHARSET` token marks the place in the HTML output where the name of the source document's character set is inserted. It would be used in the tag `< charset=$CHARSET>`.

Word documents are split into blocks by heading level. By default, each section of text between Heading Level 1 headings will be a single block.

See the template files for examples of how to use tokens.

Export Tokens

Token	Description
<code>\$ANCHOR</code>	Inserts an anchor for a heading level (h2-h6) for the current block.
<code>\$BASE</code>	Inserts the base URL for the HTML file. Use in the <code><base href=xx></code> tag.
<code>\$CHARSET</code>	Inserts the character set of the source document, if that information is ascertainable. Supported Formats, on page 276 lists the file formats for which character set information can be determined.
<code>\$CONTENT</code>	Inserts the content of the metadata field specified by the <code>\$NAME</code> token. This token is used in conjunction with the <code>\$SUMMARY</code> , <code>\$USERSUMMARY</code> , and <code>\$NAME</code> tokens to insert source document metadata into the HTML output. An example of this token's use is: <code>pszUserSummary=<meta name="\$NAME" content="\$CONTENT"></code> Supported Formats, on page 276 lists file formats that support metadata.
<code>\$ENDNOTE</code>	Inserts endnotes from the current block at this point in the output stream. Currently implemented for Microsoft Word documents only.
<code>\$ENDNOTEALL</code>	Inserts all endnotes at this point in the output stream. Currently implemented for Microsoft Word documents only.
<code>\$FOOTER</code>	Inserts the footer from the current block at this point in the output stream.
<code>\$FOOTNOTE</code>	Inserts footnotes from the current block at this point in the output stream. Currently implemented for Microsoft Word documents only.
<code>\$FOOTNOTEALL</code>	Inserts all footnotes at this point in the output stream. Currently implemented for Microsoft Word documents only.
<code>\$HEADER</code>	Inserts the header from the current block at this point in the output stream.
<code>\$MAINURL</code>	Inserts the URL to the file containing the start of the generated HTML, that is,

Export Tokens, continued

Token	Description
	output stream.
\$NAME	<p>Inserts the name of a metadata field. This token is used in conjunction with the \$SUMMARY, below, \$USERSUMMARY, on the next page, and \$CONTENT, on the previous page tokens to insert source document metadata into the HTML output. An example of this token's use is:</p> <pre>pszUserSummary=<meta name="\$NAME" content="\$CONTENT"></pre> <p>The section Supported Formats, on page 276 lists file formats that support metadata.</p>
\$NEXT	Inserts the anchor to the next block. If this is the last block, a link to the first block is inserted.
\$PREV	Inserts the anchor to the previous block. If the current block is the first block, a link to the last block is inserted.
\$STYLESHEET	Inserts the path to the style sheet. Only available in KVHTMLOptionsEx.
\$SUMMARY	<p>Inserts the data from standard metadata fields using the markup provided in the pszUserSummary member of the structure KVHTMLTemplateEx. Standard fields are enumerated from 0 to 33 in KVSumType in kvtypes.h. See the tokens \$USERSUMMARY, on the next page, \$NAME, above, and \$CONTENT, on the previous page.</p> <p>The section Supported Formats, on page 276 lists file formats that support metadata.</p>
\$SUMMARYNN	<p>Inserts the data from a <i>specified</i> metadata field. <i>NN</i> is a number from 0 through 33 enumerated in the KVSumType structure in kvtypes.h. An example of this token's use is:</p> <pre>pszMainTop=<head> <title> \$SUMMARY01 </title> </head> <body></pre> <p>The section Supported Formats, on page 276 lists file formats that support metadata.</p>
\$SPLITBLOCKNUMBER	Inserts the page number for each block generated as a result of bHardPageMakesNewBlock or lcbBlockSize.
\$TOC	Inserts the table of contents at this point in the current output stream. This token is typically embedded in pszMainTop.
\$TOCB	Inserts the table of contents at this point for the current block.
\$TOCBE	Inserts the beginning entry for the table of contents at this point in the current output stream.
\$TOCE	Inserts a table of contents entry at this point in the current output stream.
\$TOCTE	Inserts a text entry without HTML markup at this point in the current output

Export Tokens, continued

Token	Description
	stream.
\$TOCPE	Inserts a partial table of contents entry at this point in the current output stream. HTML tags are removed; however, character entities are retained. This enables angle brackets to appear in the table of contents entries (for example, <text>). Without this token, <text> would be interpreted as a non-valid HTML tag and would be ignored by the browser.
\$TOPANCHOR	Inserts the anchor for the top heading level (h1) for the current block.
\$USERCB	Triggers the callback function <code>UserCB()</code> and identifies the callback used in the function.
\$USERSUMMARY	<p>Inserts the data from <i>every</i> valid non-standard metadata field using the markup provided in the <code>pszUserSummary</code> member of the <code>KVHTMLTemplateEx</code> structure. Non-standard metadata are any fields not listed from 0 to 33 in <code>KVSumType</code>, such as user-defined fields (for example, custom property fields in Word documents), or fields that are unique to a particular file type (for example, "Artist" or "Genre" fields in MP3 files). See the tokens \$SUMMARY, on the previous page, \$NAME, on the previous page, and \$CONTENT, on page 359.</p> <p>The section Supported Formats, on page 276 lists file formats that support metadata.</p>
\$XANCHOR	<p>Inserts the anchor to an extra file into the HTML output. An example of this token's use is:</p> <pre><frame src="\$XANCHOR" name="Left" scrolling="auto" target="right"></pre> <p>The contents of the extra file is defined by <code>pszXFile</code>, and the block generated by this token is defined by <code>pszXStartBlock</code> and <code>pszXEndBlock</code>.</p>

Appendix F: File Format Detection

This section describes how file formats are detected in the KeyView Export SDK.

• Introduction	362
• Extract Format Information	362
• Determine Format Support	362
• Translate Format Information	364
• Determine a Document Reader	366
• Category Values in formats_e.ini	366

Introduction

The KeyView format detection module (`kwad`) detects a file's format, and reports the information to the API, which in turn reports the information to the developer's application. If the detected format is supported by the KeyView SDK, the detection module also loads the appropriate structured access layer and document reader for further processing.

For a list of supported formats, see [Supported Formats, on page 276](#).

Extract Format Information

You can extract format information from a document by using the `fpGetStreamInfo()` function. If required, this format information can then be reported to the developer's application. The `fpGetStreamInfo()` function extracts format information, such as file class, format, and version, and populates the `ADDOCINFO` structure. This structure is defined in the `adinfo.h` header file.

For information on how to translate the extracted format information, see [Translate Format Information, on page 364](#).

Determine Format Support

After the file format is extracted, the detection module uses the `formats_e.ini` file to determine whether the format is supported by KeyView, and the appropriate structured access layer and reader to load.

The `formats_e.ini` file is in the directory `install\OS\bin`, where `install` is the path name of the Export installation directory and `OS` is the name of the operating system. It contains the following information:

- Coded format information. To translate this information, see [Translate Format Information, on page 364](#).
- The reader associated with each format. See [Determine a Document Reader, on page 366](#).

- Configuration parameters for out-of-process conversions.
- Locale settings for internal use.

Below are some entries from the `formats_e.ini` file:

```
123=mw
152=xyw
178=wp6
189=mw6
2=af
200=pdf
205=mb
210=htm
251=htm
```

NOTE: The `formats_e.ini` file applies to all formats except graphics. Detection of graphics formats is handled by an internal module named KeyView Picture Interchange Format (KPIF).

Refine Detection of Text Files

During text detection, KeyView analyzes the first 1 kB and last 1 kB of data in a document; if less than 10% of that data consists of non-ASCII characters, KeyView detects the document as a text file.

However, depending on the type of documents you are working with, the default settings might not provide the desired level of accuracy. Configuration flags allow you to change the amount of data to read at the end of a file, the percentage of non-ASCII characters permitted in a text file, and whether to use or ignore the file extension to determine the document format.

Change the Amount of File Data to Read

During file detection, KeyView reads characters from the beginning and end of a file—by default, it reads the first and last 1,024 bytes of data. Large text files might contain many irrelevant characters at the end of a file, so KeyView might not accurately detect the file format. You can set a configuration flag to increase the amount of data to read from the end of a file during detection.

To change the amount of data to read during detection

- In the `formats_e.ini` file, set the following flag in the `detection_flags` section:

```
[detection_flags]
non_ascii_chars_end_block_size=kB
```

where *kB* is the number of kilobytes to read from the end of the file, from 0 to 10. The default value is 1.

NOTE: The file size must be greater than the value specified in the flag. If the flag value is greater than the file size, KeyView does not use the flag.

Change the Percentage of Allowed Non-ASCII Characters

By default, if less than 10% of the analyzed data in a document consists of non-ASCII characters, it is detected as a text file. Depending on the type of files you are working with, changing the default percentage might increase detection accuracy.

To change the percentage of non-ASCII characters allowed in text files

- In the `formats_e.ini` file, set the following flag in the `detection_flags` section:

```
[detection_flags]
non_ascii_chars_in_text=N
```

where *N* is the percentage of non-ASCII characters to allow in text files. Files that contain a lower percentage of non-ASCII characters than *N* are detected as text files. The default value is 10.

Use the File Extension for Detection

Sometimes KeyView detects certain file formats (such as CSV) as ASCII because of the content of the documents. In such cases, you can configure KeyView to use the file extension to determine the document format. Using the file extension can improve detection of formats such as CSV, but might not detect text files successfully if they have incorrect file extensions.

To use the file extension for ASCII files during detection

- In the `formats.ini` file, set the following flag in the `detection_flags` section:

```
[detection_flags]
use_extension_for_ascii=1
```

The default is 0 (do not use the file extension).

Allow Consecutive NULL Bytes in a Text File

By default, if a document contains consecutive NULL bytes, it is not detected as text. Depending on the type of files you are working with, changing the default might increase detection accuracy.

To allow consecutive NULL bytes of ASCII characters in text files

In the `formats.ini` file, set the following flag in the `detection_flags` section:

```
[detection_flags]
ascii_allow_null_bytes=1
```

The default value is 0 (do not allow consecutive NULL bytes).

Translate Format Information

Format information can include file attributes in the following categories:

- Major format
- File class
- Minor format
- Major version
- Minor version

Not all categories are required. Many formats only include major format and file class, or major format only.

The format information has the following structure:

MajorFormat.FileClass.MinorFormat.MajorVersion.MinorVersion

For example:

81.2.0.9.0

Each number in the format information represents a file attribute. The entry 81.2.0.9.0 represents a Lotus 1-2-3 Spreadsheet file version 9.0, where:

81 = Lotus 1-2-3 Spreadsheet (major format)

2 = Spreadsheet (file class)

0 = not defined (minor format)

9 = 9 (major version)

0 = 0 (minor version)

The example above applies to `formats_e.ini` file. When extracting format information by using the `fpGetStreamInfo()` function method, the same format information is represented as 294.2.0.9.

NOTE: The format values returned by `fpGetStreamInfo()` differ from those in `formats_e.ini` because the former defines a unique ID for each major format, whereas the latter uses a major version, minor version, and minor format to distinguish between formats.

Distinguish Between Formats

The `ADDONINFO` structure method provides a unique ID for each major format. For example, a call to `fpGetStreamInfo()` returns 351.1.0 for a Microsoft Word 2003 XML format. The major format 351 is unique to this format.

Unlike `ADDONINFO`, the `formats_e.ini` file distinguishes between formats by using the major version number. For example, in `formats_e.ini`, a Microsoft Word 2003 XML format is defined as 285.1.0.100.0. The major format 285 and file class 1 are the same values for generic XML. The major version 100 distinguishes the format as Microsoft Word 2003 XML.

The major version is used in `formats_e.ini` to specify the following formats:

- The Microsoft Office 2003 XML format has the same major format and file class as generic XML (285.1). It is distinguished from generic XML by using the following major versions:
 - Word: 100
 - Excel: 101
 - Visio: 110

- The XHTML format has the same major format and file class as HTML (210.1). It is distinguished from HTML by using the major version 100.

Determine a Document Reader

The format detection module uses the `formats_e.ini` file to determine whether a format is supported and which reader should be used to parse a format. The entries in the `formats_e.ini` file lists each format's coded value, and an abbreviation for the format's reader. For example:

```
81.2.0.9.0=1123
```

The reader abbreviation is a truncated version of the reader's library name. Adding "sr" to the end of an abbreviation creates the name of the reader. The example entry above specifies that a Lotus 1-2-3 Spreadsheet file version 9.0 is parsed by the Lotus 1-2-3 reader, 1123sr.

[Files Required for Redistribution, on page 385](#) lists the document readers provided with KeyView.

Category Values in formats_e.ini

This section lists the possible category values for format information in the `formats_e.ini` file. The corresponding values for the format information extracted from a call to `fpGetStreamInfo()` are listed in the `adinfo.h` header file.

- [Major Formats](#)

1 If the major version is 100, the file format is XHTML.

2 The major version determines whether the Microsoft Office XML file is a Word, Excel or Visio document. The major version for each format is as follows:

Word: 100

Excel: 101

Visio: 110

Appendix G: Files Required for Redistribution

This section lists the Export files that can be redistributed in your applications under the licensing agreement. These files are in the directory *install\OS\bin*, where *install* is the path name of the Export installation directory and *OS* is the name of the operating system.

- [Core Files](#)385
- [Support Files](#)386
- [Document Readers and Writers](#)387

NOTE: On Windows systems, the libraries are .dll files. On UNIX systems, the libraries are .so, .a, or .sl files.

Core Files

The following core files can be redistributed with your application.

File	Description
formats_e.ini	Initialization file. For more information on this file, see Determine Format Support, on page 362 .
htmlexport.*	Required by the Java API.
htmsserv.dll	The in-process version of the HTML Export COM interface.
htmsserv.exe	The out-of-process version of the HTML Export COM interface.
htmconv.*	HTML converter for the document token stream.
kpifcnvt.*	Graphic conversion routines.
kpifutil.*	Graphic utility routines.
kvxtract.*	File Extraction interface.
kvhtml.*	HTML Export C API.
kvexport.*	Export C API. Interface to the HTML and XML Export C APIs.
kvexportdotnet.*	Interface for .NET support.
kvolefio.*	Embedded OLE object writer.
kvutil.*	Internal KeyView utility functions.
kvxpgsa.*	Interface between presentations or graphic readers and the Export API.

File	Description
kvxssa.*	Interface between spreadsheet readers and the Export API.
kvxwpsa.*	Interface between word processing readers and the Export API.
kwad.*	File auto-recognition module.
regsvr32.exe	A Microsoft Windows program used to register in-process COM objects.
txtcnv.*	Converter for document token stream.
xmlexport.*	Required by the Java API.
\vcredist	Microsoft Visual C++ 2010 and Microsoft Visual Studio C++ 2005 Redistributables. NOTE: On Windows platforms, the Microsoft Visual C++ 2010 and Microsoft Visual Studio C++ 2005 Redistributables need to be deployed and installed for KeyView to run.

Support Files

The following support files can be redistributed with your application.

File	Description
bentofio.*	Required by l123sr.* and kpprzrdr.*.
cbmap.map	Character mappings for Adobe Portable Document Format (PDF).
chartbls.ux	Character mapping tables.
chmdll.*	Required by chmsr.
kp3dwrld.*	Required for 3D charts.
kpchtrdr.*	Required for all spreadsheets (chart support).
kpjavwrt.*	Java utility routines.
kpjpeg.*	JPEG file interchange format shared routines.
kppng.*	Portable Network Graphics (PNG) utilities.
kvxconfig.ini	Contains element extraction settings for source XML files.
kvgraph.*	Required for all spreadsheets (chart support).
kvpie.*	Required for all spreadsheets (chart support).
kvradar.*	Required for all spreadsheets (chart support).

File	Description
kv.lic	Contains license information for KeyView products. This file is opened and validated when a KeyView API is used.
kvraster.class	Java program used to convert vector graphics on UNIX and Linux.
kvVector.class	Java applet used to convert vector graphics on UNIX and Linux.
kvvector.jar	Java applet used to convert vector graphics on UNIX and Linux. This must reside in the output directory.
mscomctl.ocx	Microsoft Common Control (for example, labels, dialog boxes). Required for Visual Basic programs and COM objects.
msvbvm60.*	Microsoft Visual Basic Runtime library V6.0.
MSVCP60.*	Microsoft Visual C++ Runtime Library V6.0.
msvcrt.*	Microsoft Visual C Runtime library.
oleaut32.*	Microsoft OLE Automation Controls.
olepro32.*	Microsoft OLE property support library.
servant.exe	Executable required for out-of-process conversions.
wpmap.*	Extended character mapping for WordPerfect and Corel Presentation.
xmlsh.*	Contains a library of content handlers for each XML file type. Required by the Expat XML parser.

Document Readers and Writers

The following readers and writers can be redistributed with your application.

File	Description
ad1sr.*	AD1 Evidence file reader
afsr.*	ASCII reader
assr.*	Applix spreadsheet reader
awsr.*	Applix Words reader
bkfsr.*	Microsoft Backup File reader
bzip2sr.*	Bzip2 reader

File	Description
cabsr.*	Microsoft Cabinet format reader
cebsr.*	Founder Chinese E-paper Basic reader
chmsr.*	Microsoft Compiled HTML Help reader
csvsr.*	Comma-Separated Values reader
dbfsr.*	dBase Database reader
dbxsr.*	Microsoft Outlook Express DBX reader
dcasr.*	Document Content Architecture/Revisable Form Text (DCA/RFT) reader
difsr.*	Data Interchange Format reader
dmgsr.*	Mac Disk Copy Disk Image File reader
dw4sr.*	DisplayWrite 4 reader
dxlsr.*	Domino XML Language reader
emlsr.*	Microsoft Outlook Express (EML) reader. This is used to convert EML files when the MBX reader is not licensed.
emxsr.*	Legato EMailXtender archive (EMX) reader
encasesr.*	Expert Witness Compression Format (EnCase) v6 reader
encase2sr.*	Expert Witness Compression Format (EnCase) v7 reader
entsr.*	Microsoft Entourage Database Format reader
epubsr.*	Open Publication Structure eBook reader
foliosr.*	Folio Flat File reader
gwfssr.*	GroupWise FileSurf reader
h17sr.*	Health level7 reader (metadata only)
htmsr.*	HTML and XHTML reader
hwposr.*	Hangul 2002, 2005, 2007 reader
ichatsr.*	Apple iChat Log reader
icssr.*	Microsoft Outlook iCalendar reader
isosr.*	ISO-9660 CD Disc Image Format reader
iwsssr.*	Apple iWork Numbers reader
iwwpsr.*	Apple iWork Pages reader

File	Description
jp2000sr.*	JPEG 2000 metadata reader
jtdsr.*	JustSystems Ichitaro reader
kpagrdr.*	Applix Presents reader
kpanirdr.*	Animated cursor reader
kpbmprdr.*	Windows Bitmap reader
kpbmpwrt.*	Windows Bitmap writer
kpcdrdr.*	Corel Draw
kpcgmrdr.*	Computer Graphics Metafile reader
kpcgmwrt.*	Computer Graphics Metafile writer
kpdcxrdr.*	DCX (fax) reader
kpDWGrdr.*	AutoCAD Drawing format reader
kpDXFrdr.*	AutoCAD Drawing Exchange format reader
kpemfrdr.*	Enhanced Metafile reader
kpepsrdr.*	Encapsulated PostScript (EPS) reader
kpgifrdr.*	Graphic Interchange Format (GIF) reader
kpicordr.*	Windows Icon reader
kpiwprdr.*	Apple iWork Keynote reader
kpjbig2rdr.*	JBIG2 reader
kpjp2000rdr.*	JPEG 2000 reader
kpjpgdrdr.*	JPEG file interchange format reader
kpjpgwrt.*	JPEG file interchange format writer
kpnbmprdr.*	IBM Notes Bitmap reader (for embedded images in DXL files)
kpmacrdr.*	MacPaint reader
kpmsordr.*	Microsoft Office Drawing Objects (office 97, 2000, and XP) reader
kpodfrdr.*	Oasis Open Document Format presentation (ODP) reader
kpODArdr.*	AutoCAD reader (Windows only)
kpONErdr.*	Microsoft OneNote reader
kppdfrdr.*	Adobe Portable Document File (PDF) graphic-based reader

File	Description
kppdf2rdr.*	High-fidelity Adobe Portable Document File (PDF) graphic-based reader
kpp40rdr.*	Microsoft PowerPoint PC 4.0 and PowerPoint Mac reader
kpp95rdr.*	Microsoft PowerPoint 95 reader
kpp97rdr.*	Microsoft PowerPoint 97 and higher reader
kppctrdr.*	Macintosh Quick Draw Picture (PICT) reader
kppcxrdr.*	PC Paintbrush (PCX) reader
kppdfrdr.*	Graphic-based Adobe Portable Document File (PDF) reader
kppicrdr.*	Pictor PC Paint format (PIC) reader
kppngrdr.*	Portable Network Graphics (PNG) reader
kppngwrt.*	Portable Network Graphics (PNG) writer
kpppxrdr.*	Microsoft PowerPoint XML reader 2007
kpprerdr.*	Lotus Freelance Graphics for Windows V2.0 reader
kpprzrdr.*	Lotus Freelance Graphics 96/97/98 reader
kpsdwrdr.*	Lotus Ami Pro Graphics reader
kpsgirdr.*	SGI RGB reader
kpshrdr.*	Corel Presentations reader
kpsunrdr.*	Sun Raster reader
kptgardr.*	Truevision Targa reader
kptifdrdr.*	Tagged Image File Format (TIFF) reader
kpvdrdr.dll	Microsoft Visio reader
kpVSDXrdr.dll	Microsoft Visio 2013 reader
kpwg2rdr.*	WordPerfect Graphics 2 reader
kpwifrdr.*	Windows Metafile reader
kpwfwrt.*	Windows Metafile writer
kpwgrdr.*	WordPerfect Graphics 1 reader
kpxfdl1rdr.*	Extensible Forms Description Language reader
kvgzsr.*	GZIP reader
kvhqxsr.*	BinHex reader

File	Description
kvzeesr.*	UNIX Compress reader
l123sr.*	Lotus 123 v96/97/98 reader
lasr.*	Lotus AMI Pro reader
ltbenn30.dll	Lotus Word Pro support (supported on Windows x86 platform only)
ltscsn10.dll	Lotus Word Pro support (supported on Windows x86 platform only)
lwpapin.dll	Lotus Word Pro support (supported on Windows x86 platform only)
lwppann.dll	Lotus Word Pro support (supported on Windows x86 platform only)
lwpsr.dll	Lotus Word Pro reader (supported on Windows x86 platform only)
macbinsr.*	MacBinary reader
mbsr.*	Microsoft Word Macintosh reader
mbxsr.*	Mailbox (MBX) ¹ and Microsoft Outlook Express (EML) reader
mdbsr.*	Microsoft Access reader.
mifsr.*	Adobe Maker Interchange Format reader
misr.*	Microsoft Word 2 reader
mp3sr.*	MP3 reader for metadata extraction
mppsрr.*	Microsoft Project reader
msgsr.*	Microsoft Outlook (MSG) reader
mspubsr.*	Microsoft Publisher reader
msw6sr.*	Microsoft Works 6 and 2000 reader
mswsr.*	Microsoft Works V1 and 2 reader
multiarcsr	ARJ reader
mw6sr.*	Microsoft Word 95 reader
mw8sr.*	Microsoft Word 97, 2000, and XP reader
mwsr.*	Microsoft Word for DOS and Microsoft Write reader
mwssr.*	Microsoft Works Spreadsheet reader
mwxsr.*	Microsoft Word 2007 XML reader

¹This reader is an advanced feature and is sold and licensed separately from KeyView Export SDK.

File	Description
nsfsr.*	IBM Notes Database reader ¹
oa2sr.*	Fujitsu Oasys reader
odfsssr.*	Oasis Open Document Format spreadsheets (ODS) reader
odfwpsr.*	Oasis Open Document Format word processing (ODT) reader
olesr.*	Embedded OLE object reader.
olmsr.*	Microsoft Outlook for Macintosh reader
oo3sr.*	Omni Outliner reader
pdfsr.*	Adobe Portable Document File (PDF) reader
pffsr.*	Microsoft Outlook Offline Storage File reader
pstsr.dll	Microsoft Outlook Personal Folders file MAPI-based reader (supported on Windows platform only) ²
pstnsr.*	Microsoft Outlook Personal Folders file native reader ³
qpssr.*	Quattro Pro spreadsheet reader
rarsr.*	RAR Archive reader
rtfsr.*	Microsoft Rich Text Format reader
skypesr.*	Skype log file reader
sosr.*	StarOffice/OpenOffice reader
swfsr.*	Macromedia Flash reader
tarsr.*	Tape archive reader
tnefsr.*	Transfer Neutral Encapsulation Format reader
unihtmsr.*	Unicode HTML reader
unisr.*	Unicode reader
unzip.*	Zip file reader
uudsr.*	UUEncoding reader
vsdsr.*	Microsoft Visio reader

¹This reader is an advanced feature and is sold and licensed separately from KeyView Export SDK.

²This reader is an advanced feature and is sold and licensed separately from KeyView Export SDK.

³This reader is an advanced feature and is sold and licensed separately from KeyView Export SDK.

File	Description
vcfsr.*	Microsoft Outlook vCard Contact reader
wkssr.*	Lotus 1-2-3 v2.0 through 5.0 reader
wosr.*	WordPerfect 5.x reader
wp6sr.*	WordPerfect 6.0 through 10.0 reader
wpmsr.*	WordPerfect for Macintosh reader
xlsbsr.*	Microsoft Office 2007 Excel Binary Format reader
xlssr.*	Microsoft Excel reader
xlxsxr.*	Microsoft Excel 2007 XML reader
xmlsr.*	Generic XML reader
xpssr.*	XML Paper Specification reader
xywsr.*	XYWrite reader
yimsr.*	Yahoo! Instant Messenger reader
z7zsr.*	7-Zip reader

Appendix H: Password Protected Files

This section lists supported password-protected container and non-container files and describes how to open them.

- [Supported Password Protected File Types](#)394
- [Open Password Protected Container Files](#)395
- [Export Password Protected Files](#) 395

Supported Password Protected File Types

The following table lists the password-protected file types that KeyView supports.

Key to support table

Symbol	Description
Y	Format is supported.
N	Format is not supported.
S	Support for viewing subfiles.
V	Support for viewing content.
P	Password required.
C	Password and certificate or User ID file required.

Supported password-protected file types

File Type	Version	Filter	Export	Extract	View	Credentials
PST (Windows)	n/a	N	N	Y	S	P
PST (non-Windows) ¹	n/a	N	N	Y	S	N
ZIP	n/a	N	N	Y	S	P
7-Zip	n/a	N	N	Y	S	P
RAR	n/a	N	N	Y	S	P
SMIME in MSG, EML, MBX	n/a	N	N	Y	N	C
Lotus Notes NSF	n/a	N	N	Y	N	C

¹The native PST reader, `pstnsr`, does not require credentials to open password-protected PST files that use compressible encryption.

Supported password-protected file types, continued

File Type	Version	Filter	Export	Extract	View	Credentials
Adobe PDF	n/a	Y	Y	Y	V	P
Microsoft Office	97-2003 2007 2010	Y	Y	Y	V	P

Open Password Protected Container Files

This section describes how to extract password-protected container files using the C API. The following guidelines apply to specific file types.

- **IBM Notes NSF files.** If you are running a Notes client with an active user connected to a Domino server, you must specify the user's password as a credential regardless of whether the NSF files you are opening are protected. This enables KeyView to access the Notes client and the IBM Notes API. If the Notes client is not running with an active user, KeyView does not require credentials to access the client.
- **PST files.** To open password-protected PST files that use High Encryption (Microsoft Outlook 2003 only), you must use the MAPI-based PST reader (pstsr). The native PST reader (pstnsr) returns the error message `KVERR_PasswordProtected` if a PST is encrypted with High Encryption.

To open container files

1. Define the credential information in the `KVOpenFileArg` data structure.
2. Pass `KVOpenFileArg` to the `fpOpenFile()` function.
3. Call `fpCloseFile()`.

Export Password Protected Files

This section describes how to export password-protected non-container files with the C API.

To export password-protected files

1. Call the `fpInit()` function.
2. Call the `KVHTMLConfig()` function with the following arguments :

Argument	Parameter
----------	-----------

<code>nType</code>	<code>KVCFG_SETPASSWORD</code>
--------------------	--------------------------------

<code>nValue</code>	<code>TRUE</code>
---------------------	-------------------

<code>pData</code>	The source file password. The password is a null-terminated string with a maximum length of 255 characters (the final byte is null).
--------------------	--

For example:

```
(*fpHTMLConfig)(pKVHTML, KVCFG_SETPASSWORD, TRUE, password);
```

where password is a null-terminated string of 255 or fewer characters.

3. Call the `fpConvertStream()` or `KVHTMLConvertFile()` function.

Send documentation feedback

If you have comments about this document, you can [contact the documentation team](#) by email. If an email client is configured on this system, click the link above and an email window opens with the following information in the subject line:

Feedback on HTML Export SDK C and COM Programming Guide (Micro Focus KeyView 11.6)

Add your feedback to the email and click **Send**.

If no email client is available, copy the information above to a new message in a web mail client, and send your feedback to swpdl.idoldocsfeedback@microfocus.com.

We appreciate your feedback!
